
PROJECT DEVELOPMENT & ENVIRONMENT (PD&E) STUDY

Work Program Item Segment No: 424501-1

Final Design Traffic Technical Memorandum (DTTM)

Project Development and Environment (PD&E) Study

I-275/SR 93

From South of 54th Avenue South
to North of 4th Street North

Pinellas County, Florida

April 2016

FDOT

Executive Summary

The Florida Department of Transportation (FDOT), District Seven, is conducting a Project Development and Environment (PD&E) Study to evaluate the need for capacity and operational improvements along 16.3 miles of Interstate 275 (I-275) (State Road (SR) 93) from south of 54th Avenue South to north of 4th Street North in Pinellas County, Florida.

The objective of this PD&E Study is to assist the FDOT and the Federal Highway Administration (FHWA) in reaching a decision on the type, location, and conceptual design of the necessary improvements for I-275 to safely and efficiently accommodate future travel demand. This study will document the need for the improvements as well as the procedures utilized to develop and evaluate various improvements including elements such as proposed typical sections, special designation of travel lanes, preliminary horizontal alignments, and interchange enhancement alternatives. The anticipated social, physical, and natural environmental effects and costs of these improvements will be identified. The alternatives will be evaluated and compared based on a variety of parameters utilizing a matrix format. This process will identify the alternative that will best balance the benefits (such as improved traffic operations and safety) with the impacts (such as environmental effects and construction costs).

The PD&E Study satisfies all applicable federal and state requirements, including the National Environmental Policy Act (NEPA), in order for this project to qualify for federal-aid funding of subsequent development phases (design, right of way acquisition, and construction). The project was evaluated through the FDOT's Efficient Transportation Decision Making (ETDM) process. This project is designated as ETDM Project #12556. An ETDM Programming Screen Summary Report was published on July 26, 2013, containing comments from the Environmental Technical Advisory Team (ETAT) on the project's effects on various natural, physical, and social resources. Based on the ETAT comments, the FHWA determined that this project qualifies as a Type 2 Categorical Exclusion.

This Design Traffic Technical Memorandum (DTTM) was prepared as a component of the PD&E Study. The DTTM documents the evaluation of existing and future traffic operations of the I-275 study corridor and identifies the required geometric and traffic control features needed to meet adopted Levels of Service (LOS) standards. The DTTM was prepared in accordance with FDOT Project Traffic Forecasting Procedure, Topic No. 525-030-120 and FDOT New or Modified Interchanges Procedure, Topic No. 525-030-0160.

Existing Year (2012) Traffic Conditions

Existing traffic conditions along the I-275 study corridor were evaluated to establish a baseline for comparison of operations with and without the proposed lane continuity and express lane improvements. The results of the existing conditions analysis indicated that the majority of freeway segments along I-275 operate at an acceptable LOS D or better during both the AM and PM peak periods. In addition to performing highway capacity and level of service analyses, a highway safety evaluation of the study corridor revealed that there were 2082 crashes within the five-year period from 2009 to 2013, of which, 1088 involved property damage only, 976 involved a person being injured, and 18 fatalities. The cash rates along the 16.3-mile segment vary from a low of .367 to a high of 1.017, which is greater than the average crash rate of .681 for similar urban interstate facilities throughout the State of Florida.

Design Year (2040) Traffic Conditions

Design year (2040) traffic operational analyses were performed for a No Build and Build Alternative using travel demand forecasts provided by FDOT. The results of the analysis indicated that as many as twenty-six mainline segments on I-275 are not projected to meet the adopted LOS standard in either the AM or the PM peak hour under the No-Build Alternative. If the recommended lane continuity improvements are implemented in Segments A and B (from south of 54th Avenue South to south of Gandy Boulevard), the number of deficient roadway segments is projected to be reduced to less than fifteen segments in either the AM or PM peak hour. The specific location of this deficiency is the segment from 5th Avenue North to Gandy Boulevard. Similarly, the proposed Master Project express lanes improvement in Segment C is projected to provide acceptable LOS C or better operations within the express lanes and LOS D within the general use lanes (GULs).

Opening Year (2020) Traffic Conditions

The opening year analysis documented the future year (2020) traffic conditions with the implementation of lane continuity improvements for Segments A and B and the Starter Project express lanes in Segment C. The results of the analysis indicate that all I-275 freeway segments are projected to operate at an acceptable LOS D or better during both the AM and PM Peak hours.

Interim Year (2030) Traffic Conditions

Similar to the analysis of opening year traffic conditions, the interim year traffic analysis assumed the construction of lane continuity improvements in Segments A and B and Starter Project express lanes in Segment C. The results of the interim year traffic operational analysis indicate that the majority of I-275 freeway segments will require additional improvement to accommodate the projected travel demand.

1.0 Introduction

1.1 Project Description

The Interstate 275 (I-275) (State Road (SR) 93) project corridor extends from south of 54th Avenue South to north of 4th Street North in Pinellas County, Florida, a distance of approximately 16.3 miles. The study map is shown on **Figure 1.1** on the following page. To effectively describe and evaluate the unique transportation characteristics of the project, the study corridor is divided into three segments as listed below, and graphically displayed on **Figure 1.1**:

- Segment A: From south of 54th Avenue South to I-175, a distance of 4.6 miles;
- Segment B: From I-175 to south of Gandy Boulevard, a distance of 6.0 miles; and
- Segment C: From south of Gandy Boulevard to north of 4th Street North, a distance of 5.7 miles.

The study corridor is contained within the townships, ranges, and sections listed in **Table 1-1** (United States Geological Survey [USGS] Pass-A-Grille Beach, Fla. 1956; St. Petersburg, Fla. 1956; Safety Harbor, Fla. 1956).

Table 1-1. Township, Range, and Section Coordinates

Township	Range	Sections
32 South	16 East	2, 3, 10, and 11
31 South	16 East	1, 2, 11, 12, 13, 24, 26, 27, 34, and 35
30 South	16 East	6, 12, 13, 14, 23 through 26, 35, and 36

With respect to the Project Development and Environment (PD&E) Study section of I-275 within Segments A and B, only lane continuity improvements are being evaluated. Segment C is the focus of express or express lane improvements.

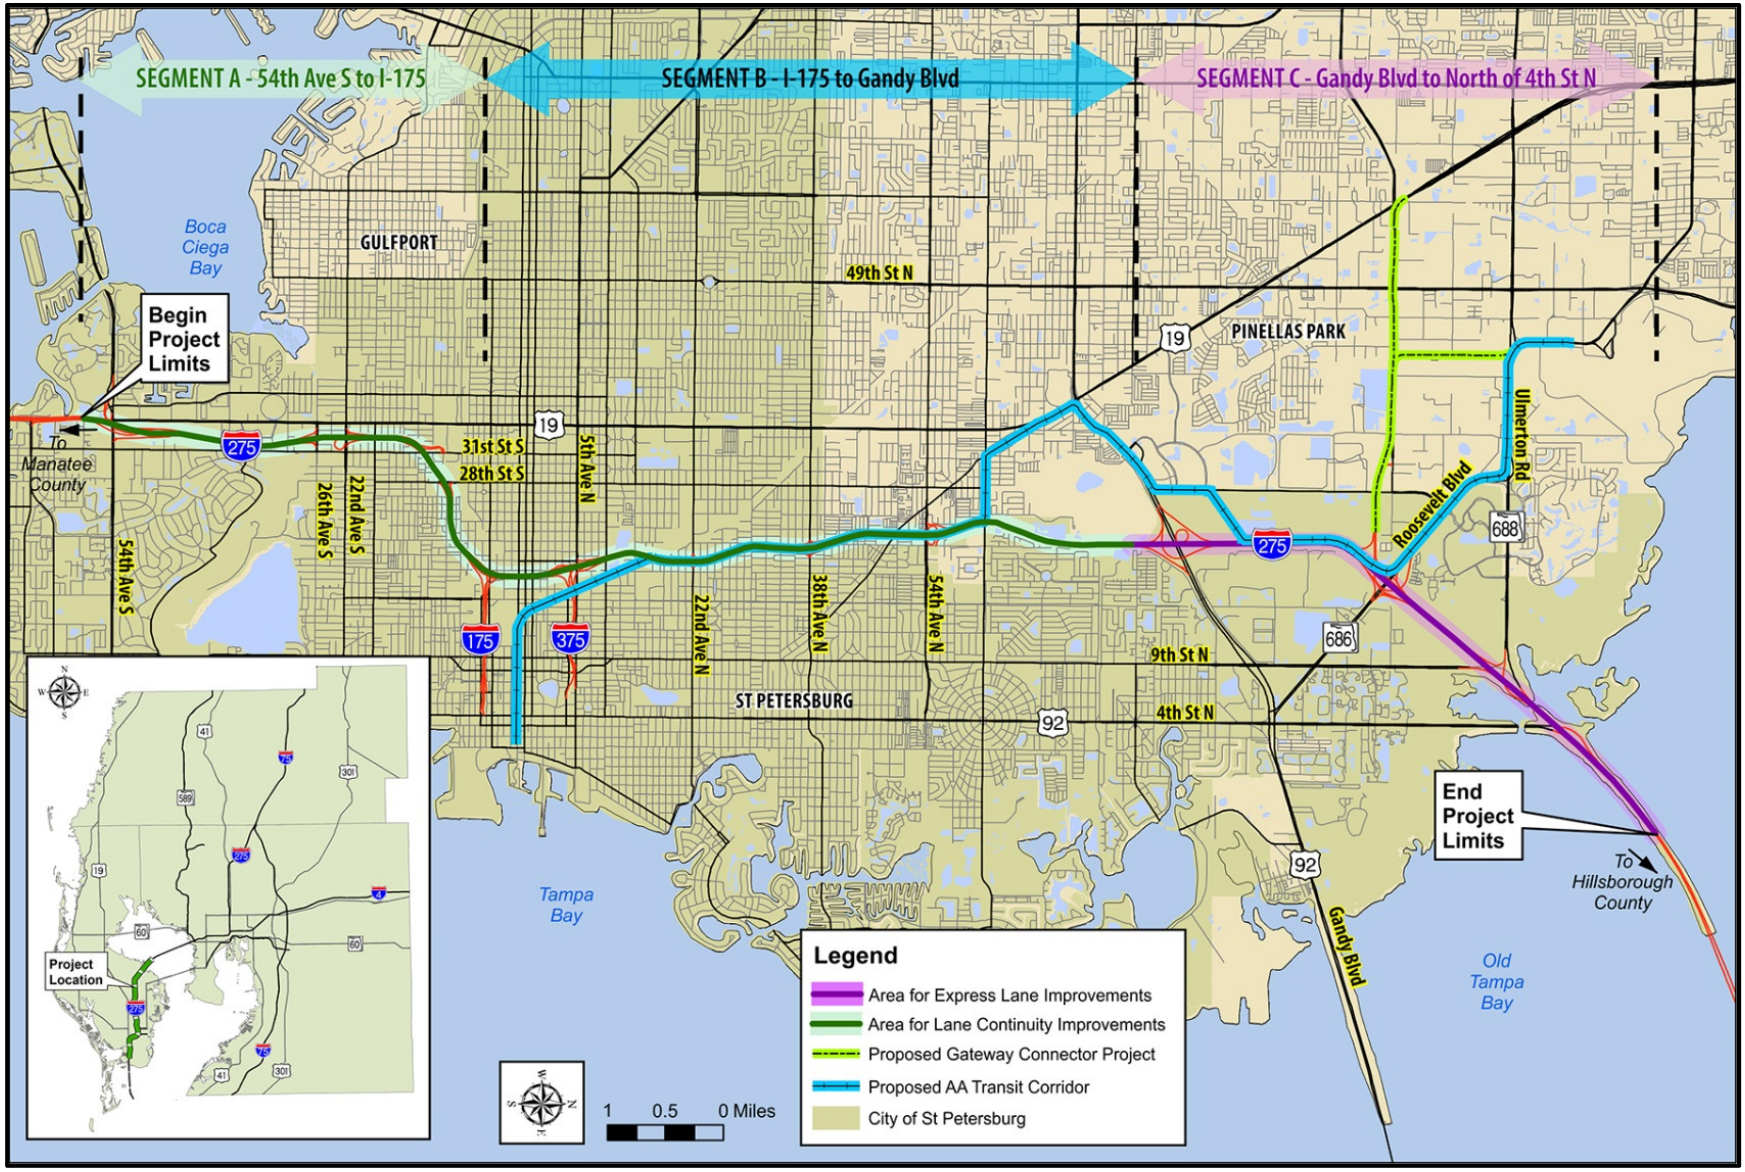

Figure 1.1. Project Location Map

1.2 Project Background

The Florida Department of Transportation (FDOT) conducted this PD&E Study to evaluate the need for capacity and operational improvements along I-275 from 54th Avenue South to north of 4th Street North in Pinellas County, a distance of approximately 16.3 miles. The objective of this PD&E Study was to provide documented environmental and engineering analyses to assist the FDOT and the Federal Highway Administration (FHWA) in reaching a decision on the type, conceptual design and location of the necessary improvements within the I-275 PD&E Study limits.

Several multimodal transportation planning studies for the I-275 PD&E Study Corridor within Pinellas County have been completed while others are presently underway. The findings from these studies are assisting the FDOT in identifying transportation improvements needed to adequately meet local and regional travel demands, as well as to support the development of the PD&E Study's Preferred Alternative. The following sections describe the relevant multimodal planning studies prepared for the I-275 corridor in Pinellas County.

1.2.1 Tampa Bay Express (TBX) Master Plan

FDOT District Seven developed the TBX Master Plan that indicates on which interstate facilities, and specific freeway segments of these facilities, it would be cost feasible to implement express lanes. This Plan ensures that the impacts of implementing express lanes on the Tampa Bay interstate system would be evaluated on a system-wide basis in lieu of treating each corridor as its own stand-alone project. The I-275 PD&E Study incorporates the TBX Master Plan improvements proposed for the I-275 study corridor as part of the Preferred Alternative along with the lane continuity improvements which would occur generally between 54th Avenue South to south of Gandy Boulevard.

Realizing a potential shortfall in funding for implementation of the Plan's ultimate capacity improvements planned for the Tampa Bay Region, the FDOT underwent an evaluation to identify a series of lower cost express lane projects that can be funded in the FDOT's Five-Year Work Program. These initial projects could be built within a five-year or less time period and then later be incorporated into the Master Plan projects at minimal additional costs. The shorter-term, lower-cost improvements are considered the "Starter Projects."

Further information regarding the development of the Master Plan and its proposed projects are documented in the TBX Master Plan document.

1.2.2 Pinellas Alternative Analysis (AA)

In addition to addressing highway capacity deficiencies, this PD&E Study also considered multimodal accommodations envisioned for the I-275 study corridor and its regional connections to the rest of Tampa Bay. The Tampa Bay Area Regional Transportation Authority (TBARTA) adopted a Transportation Master Plan for Citrus, Hernando, Hillsborough, Manatee, Pasco, Pinellas, and Sarasota Counties in May 2009. While considering all modes of transportation, the TBARTA Master Plan focused on providing the framework for an integrated transit system to serve all parts of the region. In 2009, the Hillsborough, Pinellas, Pasco, and Hernando County Metropolitan Planning Organizations (MPOs) and Citrus County all adopted the TBARTA Mid Term (2035) Networks in their 2035 Needs plans and included several key elements of the Master Plan in their 2035 Cost Affordable Long Range Transportation Plans (LRTPs).

As a first step in moving toward implementation of this Plan, the Hillsborough Area Regional Transit Authority (HART) had undertaken an AA for a light rail transit corridor running from the University of South Florida, through downtown Tampa, to the Westshore area. This HART analysis included a service connection to a proposed High Speed Rail station in downtown Tampa. A second AA has been completed by the FDOT, TBARTA, the Pinellas County MPO and the Pinellas Suncoast Transit Authority (PSTA) for a premium transit corridor from downtown St. Petersburg, through the Pinellas Gateway area, to downtown Clearwater. In addition, the FDOT, local transit agencies, and MPOs have planned several Regional Transit Corridor Evaluations for other elements of the TBARTA Master Plan.

The 2012 Pinellas AA evaluated transit options connecting major residential, employment and activity centers in Pinellas County to Hillsborough County via the Howard Frankland Bridge corridor. The study identified a 24-mile light rail Locally Preferred Alternative (LPA) for its ability to offer transportation options that are safe, sustainable, affordable, and efficient. Significant countywide local bus enhancements were recommended to support the LPA, nearly doubling the existing local bus service with portions being implemented before the light rail.

A key element of the TBARTA Master Plan is to provide a transit linkage across Upper Tampa Bay linking Hillsborough and Pinellas Counties. Specifically, both the TBARTA Master Plan and the MPO LRTPs call for the linkage to be provided across the Howard Frankland Bridge (I-275/SR 93) corridor. This linkage would run from Hillsborough County's proposed Westshore Regional Multimodal Center (service connection to the proposed High Speed Rail Station in downtown Tampa) to Pinellas County's proposed Gateway Station. These stations would not serve as termini, but would allow uninterrupted transit movements from the St. Petersburg and Clearwater areas across the Howard Frankland Bridge to and through Tampa's Central Business District (CBD) and vice versa. However, for this linkage to be possible, the Howard Frankland Bridge corridor must be able to accommodate the appropriate transit provisions. The FDOT plans to replace the northbound Howard Frankland Bridge in the future since it is approaching the end of its useful service life. Therefore, the I-275 PD&E Study will provide recommended improvements that provide the transit accommodations envisioned by TBARTA and the needed highway improvements consistent with the planned northbound bridge replacement.

1.2.3 Lane Continuity Study

Completed in October 2008, the I-275 Lane Continuity Study evaluated operational improvements on I-275 from the Sunshine Skyway Bridge North Toll Plaza to Gandy Boulevard in Pinellas County. The study documented existing and future operational and safety conditions within the corridor for the purposes of recommending possible improvements to alleviate identified deficiencies. The study addressed both short-term traffic operational type improvements and longer-term major geometric improvements. As a long range improvement, the study recommended providing lane improvements to achieve one additional continuous lane on I-275 in each direction from 54th Avenue South to Gandy Boulevard.

The I-275 Pinellas PD&E Study incorporated and updated the Lane Continuity Study recommendations. Currently, I-275 from south of 54th Avenue South to 4th Street North has one continuous lane in the northbound direction and no continuous lanes in the southbound direction. According to the previous Lane Continuity Study recommendations, proposed lane additions to I-275 are anticipated to provide three continuous lanes in the northbound direction and two continuous lanes in the southbound direction between 54th Avenue South and 4th Street North. These new lane connections will improve the safety for motorists traveling the I-275 corridor by substantially reducing

the number of lane changes for both directions of travel. The study also recommended modifications to certain interchanges within the study limits, allowing for a more refined analysis of those locations.

1.2.4 National Environmental Policy Act (NEPA) Process

The proposed project has been evaluated through the FDOT's Efficient Transportation Decision Making (ETDM) process. Agency coordination for this project has been initiated as part of ETDM Project Number 12556. The FDOT received Location Design and Concept Acceptance (LDCA) from FHWA on July 15, 2016 for lane continuity improvements along I-275 from 54th Avenue South to south of Gandy Boulevard and express lane improvements related to the TBX Master Plan project along I-275 from south of Gandy Boulevard to north of 4th Street North.

1.3 Existing Conditions

I-275 is a limited access urban interstate highway facility that runs in a north and south direction through Pinellas County. The posted speed limit is 65 miles per hour (mph). Within the project limits, I-275 is comprised of a four-lane divided typical section with auxiliary lanes from south of 54th Avenue South to I-375. From I-375 to north of 4th Street North, I-275 is comprised of a six-lane divided typical section with auxiliary lanes.

The existing roadway typical sections, as shown on **Figure 1.2(a-f)**, are described as follows:

- Segment A (from south of 54th Avenue South to I-175): consists of four 12-foot general purpose travel lanes, two 12-foot auxiliary travel lanes, 12-foot inside and outside shoulders (10-foot paved) and generally open drainage with a median width that varies from 64 to 212 feet;
- Segment B (from I-175 to south of Gandy Boulevard): consists of six 12-foot general purpose travel lanes, two or four 12-foot auxiliary travel lanes, 12-foot inside and outside shoulders (10-foot paved) and generally open drainage with a median width that varies from 64 to 204 feet; and
- Segment C (from south of Gandy Boulevard to north of 4th Street North): There are four separate typical sections within Segment C (labeled separately as C1-C4).
    - C-1 (from south of Gandy Boulevard to Roosevelt Boulevard) consists of six 12-foot general purpose travel lanes, two or four 12-foot auxiliary travel lanes, 12-foot inside and outside shoulders (10-foot paved) and generally open drainage with a median width that varies from 64 to 204 feet;
    - C-2 (from Roosevelt Boulevard to south of 9th Street North): consists of six 12-foot general purpose travel lanes, zero to four 12-foot auxiliary travel lanes, 12-foot inside and outside shoulders (10-foot paved) and generally open drainage with a median width of 40 feet;
    - C-3 (from south of 9th Street North to north of 4th Street North): consists of six 12-foot general purpose travel lanes, two to four 12-foot auxiliary travel lanes, 12-foot inside and outside shoulders (10-foot paved) with a 26-foot wide concrete median containing a two-foot traffic barrier used to separate northbound and southbound traffic on I-275;
    - C-4 (from north of 4th Street North to 1.0 mile south of the Howard Frankland Bridge): the I-275 causeway consists of six 12-foot general purpose travel lanes, two 12-foot auxiliary lanes, 10-foot paved inside and outside shoulders, and a 22-foot median. The face of the outside barrier mounted on the sea walls is approximately 40 feet from the travel lanes.

No dedicated transit facilities, frontage roads or high-occupancy vehicle (HOV) lanes are currently provided within any of the I-275 mainline Segments. I-275 includes 15 interchanges within the project limits:

1. 54th Avenue South;
2. 26th Avenue South;
3. 22nd Avenue South;
4. 31st Street South;
5. 28th Street South;
6. I-175;
7. I-375;
8. 5th Avenue North;
9. 22nd Avenue North;
10. 38th Avenue North;
11. 54th Avenue North;
12. Gandy Boulevard;
13. Roosevelt Boulevard /118th Avenue North;
14. Ulmerton Road/9th Street North; and
15. 4th Street North.

Figure 1.2. Existing Typical Sections

1.4 Project Purpose and Need

The purpose of this project is to provide for operational and safety improvements that maximize capacity within the I-275 corridor, improve lane continuity and connect I-275 within Pinellas County to the future network of express lanes planned for the Tampa Bay Region. Improvements are needed within the I-275 corridor to help alleviate existing traffic congestion, enhance safety and better accommodate future travel demands associated with projected growth in employment and population. The addition of special use/express lanes is included in the FDOT's Approved SIS Highway Component 2040 Cost Feasible Plan.

In 2012, Annual Average Daily Traffic (AADT) volumes on I-275 ranged from a low of 82,000 vehicles per day north of 54th Avenue South to a high of 142,500 vehicles per day north of 4th Street North. Under these existing traffic loadings, several sections along the I-275 mainline operate deficiently (Level of Service – LOS E) during both the morning and afternoon peak travel periods and does not meet the minimum LOS standard D for SIS highway facilities. Without improvements, the operating conditions along I-275 will continue to deteriorate, resulting in unacceptable levels of service throughout the entire study corridor.

The following information supports the proposed project's purpose and need:

Safety/Crash Rate Issues

Crash data from the Florida Department of Highway Safety and Motor Vehicles indicated there were 2,082 crashes recorded in the project limits during the five year period of 2009 through 2013. There were a total of 976 injuries and 18 fatalities. The crash rates were higher than the average statewide crash rate for urban interstates within the vicinity of certain interchanges within the project limits, and along mainline sections between 22nd Avenue and 54th Avenue North.

Safety within the project limits will be enhanced due to maximizing capacity that will be provided by the proposed lane continuity improvements on I-275. The lane continuity improvements will reduce driving decisions related to lane changes, thereby decreasing potential conflicts among vehicles.

Lane Continuity Issues

Currently, I-275 from south of 54th Avenue South to 4th Street North has one continuous lane in the northbound direction and no continuous lanes in the southbound direction. The proposed intermittent widening and restriping of existing lanes within I-275 Segments A and B comprise the lane continuity improvements that will form two continuous lanes on I-275 in each direction between 54th Avenue

South and 4th Street North; thereby improving the safety of motorists by reducing driving decisions which relate to lane changes and the incidence of associated crashes.

Managed/Special Use Lanes Intent

I-275 Segment C is a component of the Tampa Bay Express (TBX) toll lanes. As part of the TBX Master Plan, one tolled lane is to be added to I-275 in each direction from Gandy Boulevard to 118th Avenue North. From 118th Avenue North to north of 4th Street North, two tolled lanes will be provided in each direction on I-275. Access will be provided between the tolled and non-tolled lanes near Gandy Boulevard, at 118th Avenue North, and between 4th Street North and the Howard Frankland Bridge.

Proposed Improvements

The proposed action involves the provision of capacity and operational improvements along 16.3 miles of I-275 from south of 54th Avenue South to north of 4th Street North in Pinellas County, Florida. This evaluation considers the operational and highway safety benefits of implementing capacity improvements and compares them to the cost savings and minimization of adverse impacts associated with a No Build Alternative. The No Build and Build Alternatives are evaluated and compared based on a variety of parameters utilizing a matrix format. This process identifies the alternative that best balances the benefits (such as improved traffic operations and safety) with the impacts (such as environmental effects and construction costs). In addition to capacity and operational improvements, the proposed action also considers the multimodal transportation needs of the I-275 project corridor, specifically incorporation of a multimodal envelope as part of the proposed improvements in order to be consistent with the Locally Preferred Alternative (LPA) of the Pinellas Alternatives Analysis (AA).

The Preferred Build Alternative consists of providing lane continuity improvements within Segments A and B (from south of 54th Avenue South to south of Gandy Boulevard), and express lane improvements in Segment C (from south of Gandy Boulevard to north of 4th Street North). The lane continuity improvements consists of intermittent widening and restriping of existing lanes on I-275 to form two continuous lanes in each direction. In Segment B, a 40-foot (ft) multimodal transportation envelope within the I-275 median is preserved for the future implementation of light rail transit use envisioned as part of the Federal Transit Administration (FTA) approved Pinellas AA. The express lanes proposed in Segment C are part of the Tampa Bay Express (TBX) Master Plan, which consists of an integrated system of express lanes identified for the Tampa Bay Region.

The I-275 interchange modifications proposed within the project segments are as follows, these future interchange improvements will be further analyzed in appropriate interchange analysis documents:

Segment A

- 31st Street South – moving SB on ramp from a left hand merge to a right hand merge

Segment B

- 5th Avenue North – SB off ramp contains a new auxiliary lane (connected with 22nd Avenue North)
- 22nd Avenue North – SB on ramp contains a new auxiliary lane with connection to 5th Avenue North
- 38th Avenue North – Additional lane on NB off ramp (from 1 to 2).

Segment C

- 118th Avenue – new GUL and SUL ramps
- Roosevelt Boulevard – new GUL NB on ramp
- MLK Boulevard – NB on ramp widening
- Ulmerton Boulevard – NB on ramp widening
- 4th Street North – NB on ramp and SB off-ramp widening

The proposed express lane improvements initially considers (prior to the design year 2040) one express lane (EL) in each direction of I-275 from south of Gandy Boulevard to north of 4th Street North. This near-term express lanes project is known as the Starter Project. The longer-term Master Plan Project shall provide for one EL in each direction of I-275 from south of Gandy Boulevard to 118th Avenue North/Roosevelt Boulevard and two ELs in each direction of I-275 from 118th Avenue North/Roosevelt Boulevard to north of 4th Street North. The separately prepared Final Preliminary Engineering Report (PER) documents the engineering and environmental analyses conducted to assess the environmental and sociocultural effects of implementing the No Build and Build Alternatives.

1.5 Memorandum Purpose

This Design Traffic Technical Memorandum (DTTM) is one of several documents prepared as part of the PD&E Study. The DDTM documents the project's existing and future traffic conditions and defines the needed lane geometry and traffic control features to achieve acceptable levels of service in the design year (2040).

2.0 Improvement Alternatives

This DTTM was prepared as part of the PD&E Study to document the existing travel conditions along I-275, present traffic forecasts of the opening year (2020), interim year (2030) and design year (2040) travel demand along I-275 and the crossing corridors, and summarize level of service evaluations of improvement alternatives for the I-275 mainline. The DTTM concluded that the proposed improvements should consist of providing lane continuity improvements only in Segment A (from south of 54th Avenue South to I-175), lane continuity improvements which are compatible with potential multimodal improvements in Segment B (from I-175 to south of Gandy Boulevard) and adding express lanes (ELs) to the existing general use lanes (GULs) in each direction of the I-275 mainline to form express lanes in study Segment C (from south of Gandy Boulevard to north of 4th Street North). For the express lane section, two ELs would be provided in each direction of the I-275 mainline to accommodate traffic volumes forecasted in the design year (2040) under the Master Plan scenario. Alternatively, one EL would be provided in each direction of the I-275 mainline under the Starter Project scenario, in order to cost effectively provide mobility options and preserve acceptable levels of service for the regional travelers prior to the design year.

2.1 No Build Alternative

The No Build Alternative assumes that, with the exception of the improvements that are already planned and funded, the existing conditions would remain for I-275 within the project limits and only routine maintenance activities would occur until the design year 2040. The advantages to the No Build Alternative include no new costs for design and construction, no effects to existing land uses and natural resources and no disruption to the public during construction. However, the No Build Alternative would not address the project's purpose and need and would result in increased congestion and user costs. The traffic analyses for this alternative indicates that by the year 2040 a significant portion of the I-275 mainline, merge/diverge areas and ramp termini intersections would operate below acceptable levels of service.

2.2 Mainline Build Alternatives

For the I-275 mainline, two build alternatives were developed and evaluated based on alternate typical sections. In Segments A and B, the build alternative consists of lane continuity improvements, while in Segment C express lanes are considered as the build alternative. The proposed lane continuity improvements in Segments A and B provide for intermittent widening and restriping of existing lanes on I-275 to form two continuous lanes in each direction. In Segment B, a 40-foot multimodal envelope is preserved for the future implementation of light rail transit within the I-275 median as part of the Federal Transit Administration (FTA) approved Pinellas AA.

As part of the Master Plan improvements in Segment C, a single express lane is to be added in the northbound direction of mainline I-275 north of Gandy Boulevard. A second express lane is added to the northbound I-275 mainline as a direct connection from the 118th Avenue North corridor. Only one access point, located between 4th Street North and the Howard Frankland Bridge, is provided for travel between ELs and GULs. In the southbound direction, two ELs on the I-275 mainline will originate from points north/east of the Howard Frankland Bridge, with one of the ELs terminating as a direct connection to the 118th Avenue North corridor, and the second southbound I-275 mainline EL will transition back into the GULs south of Gandy Boulevard. Similar to the northbound direction,

only one access point is to be located between the Howard Frankland Bridge and 4th Street North. The express lane typical section in Segment C generally consists of six GULs (three lanes in each direction) and four ELs (two in each direction). A marked four-foot buffer containing traffic delineators (i.e., vertical PVC flexible posts) separate the ELs and the GULs.

The Starter Project improvements in Segment C consist of re-designating the existing auxiliary lanes on mainline I-275 to form a single express lane in each direction from south of the Roosevelt Boulevard corridor to the Howard Frankland Bridge. Access to the EL from the GULs is provided at three locations along the northbound I-275 mainline: 1) between Gandy Boulevard and Roosevelt Boulevard, 2) a direct connection from the 118th Avenue North corridor, and 3) between 4th Street North and the Howard Frankland Bridge. In the southbound direction of mainline I-275, the single express lane originating from points north/east of the Howard Frankland Bridge will terminate south of Gandy Boulevard. Access from the EL to the GULs is provided at three locations along the southbound I-275 mainline: 1) between the Howard Frankland Bridge and 4th Street North, 2) a direction connection to the 118th Avenue North corridor, and 3) between Gandy Boulevard and 54th Avenue North.

The widening of I-275, under both lane continuity and Starter and Master Plan express lane mainline alternatives, can be constructed within the existing right of way. Additional right of way may be required, however, for stormwater management facilities and floodplain compensation sites.

A detailed description of each mainline alternative is provided in the following pages, and a graphical depiction of the conceptual design layout of the proposed build alternative is provided in **Appendix A**.

2.2.1 Mainline Build Alternative – Segment A

Mainline Build Alternative – Segment A, proposed lane continuity improvements mainly consists of providing intermittent widening that varies between 0 and 12 ft and restriping of the existing four-lane typical section with auxiliary lanes. The proposed I-275 mainline build alternative typical section in Segment A is shown on **Figure 2.1**. As seen in this graphic, widening of I-275 is only proposed to the outside in the southbound direction.

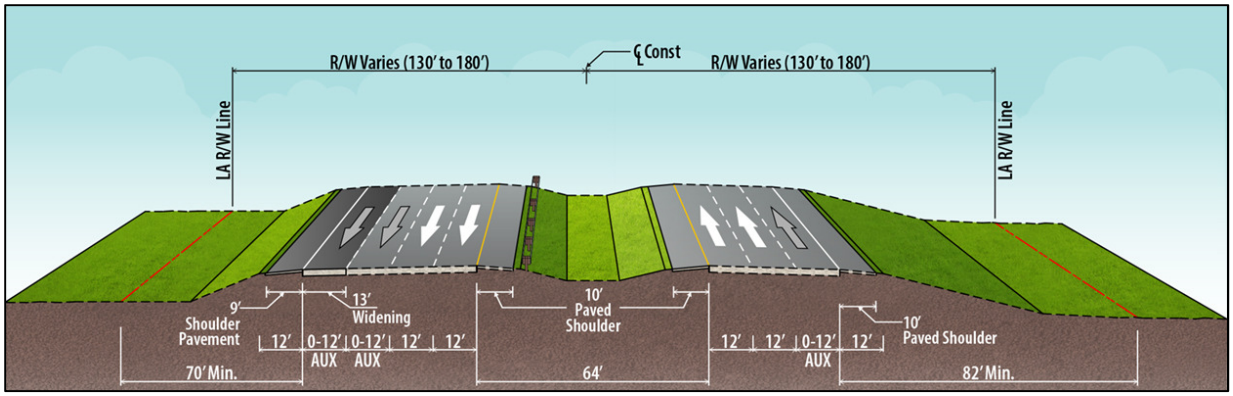

Figure 2.1. I-275 Mainline Build Alternative Typical Section from south of 54th Avenue to I-175 (Segment A)

2.2.2 Mainline Build Alternative – Segment B

Mainline Build Alternative – Segment B, proposed lane continuity improvements mainly consists of providing intermittent widening that varies between 0 and 24 ft and restriping of the existing six-lane typical section with auxiliary lanes. As previously mentioned in Section 2.2, lane continuity improvements and accommodations for future light rail transit within the I-275 median as planned in the Pinellas Alternatives Analysis are provided. The proposed I-275 mainline build alternative typical section in Segment B is shown on **Figure 2.2**.

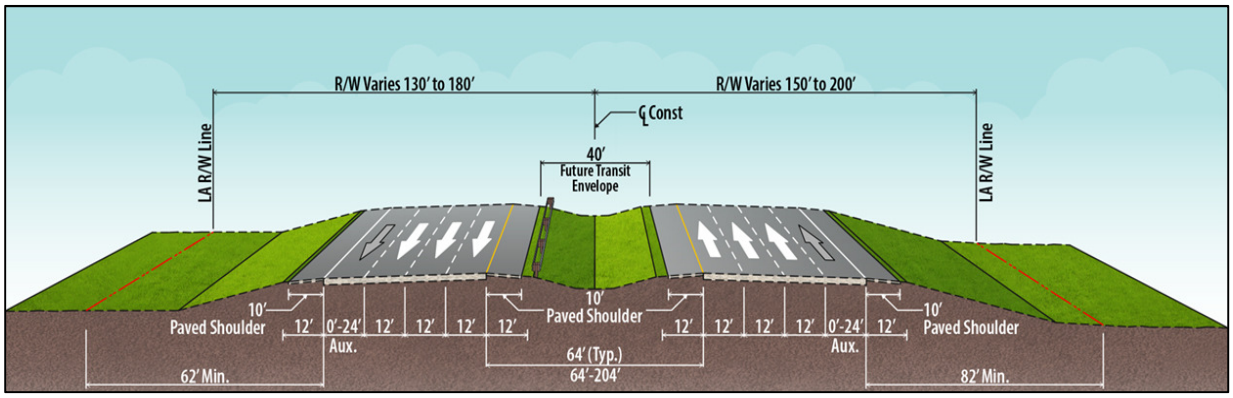

Figure 2.2. I-275 Mainline Build Alternative Typical Section from I-175 to south of Gandy Boulevard (Segment B)

2.2.3 Mainline Build Alternative – Segment C

Mainline Build Alternative – Segment C, proposed widening of I-275 consists of the addition of express lanes to form the Master Plan and Starter projects. The proposed I-275 mainline build alternative typical sections in Segment C are shown **Figure 2.3(a-d)** and **Figure 2.4(a-c)** for the Master and Starter projects, respectively.

2.2.3.1 Proposed Master Plan Improvements

The Master Plan proposes to widen the existing I-275 mainline towards the median in order to accommodate one EL in each direction from south of Gandy Boulevard to 118th Avenue North (see **Figure 2.3a** for a graphical depiction of the proposed typical section). The proposed ELs are to be

separated from the GULS by a four-foot painted buffer that is to contain traffic delineators. Direct connections from the 118th Avenue North/Gateway corridor to I-275 are provided via new flyover ramps that enter and exit I-275 from the median. **Figure 2.3b** illustrates the use of Mechanically Stabilized Earth (MSE) wall to transition 118th Avenue North flyover ramps to the at-grade I-275 mainline. From 118th Avenue North to 1.0 mile south of the Howard Frankland Bridge, two express lanes are provided in each direction of travel along I-275 (see **Figure 2.3c** and **Figure 2.3d**). In order to accommodate the proposed express lanes, the existing I-275 causeway extending into Tampa Bay will need to be widened and the existing sea wall replaced.

Figure 2.3. I-275 Mainline Build Alternative Typical Sections – Master Plan Project

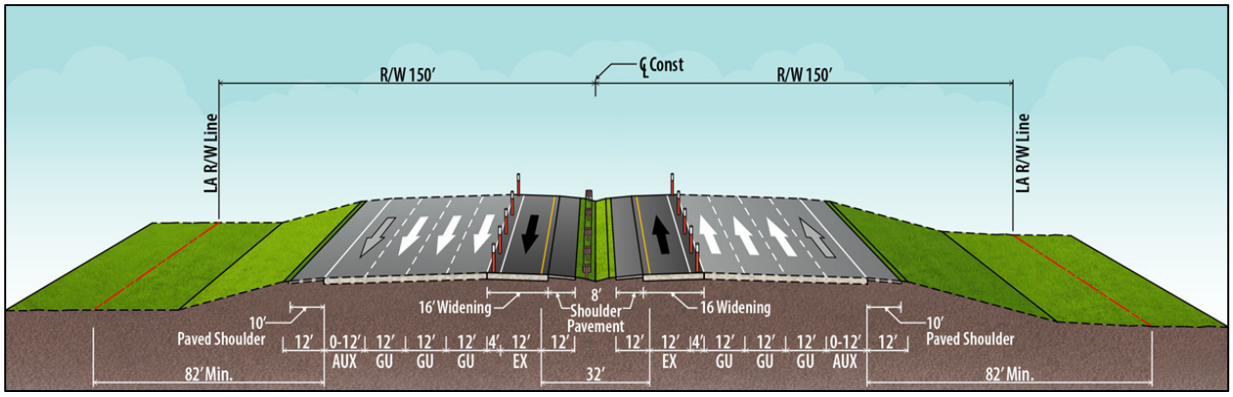

Figure 2.3a. I-275 Mainline Master Plan Build Alternative Typical Section from south of Gandy Boulevard to Roosevelt Boulevard (Segment C-MP1)

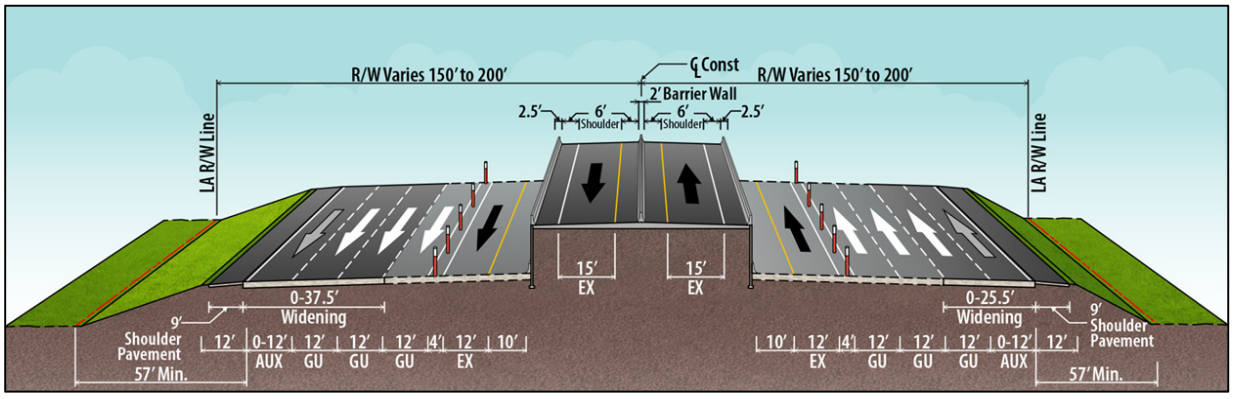

Figure 2.3b. I-275 Mainline Master Plan Build Alternative Typical Section from Roosevelt Boulevard to south of 9th Street North (Segment C-MP2)

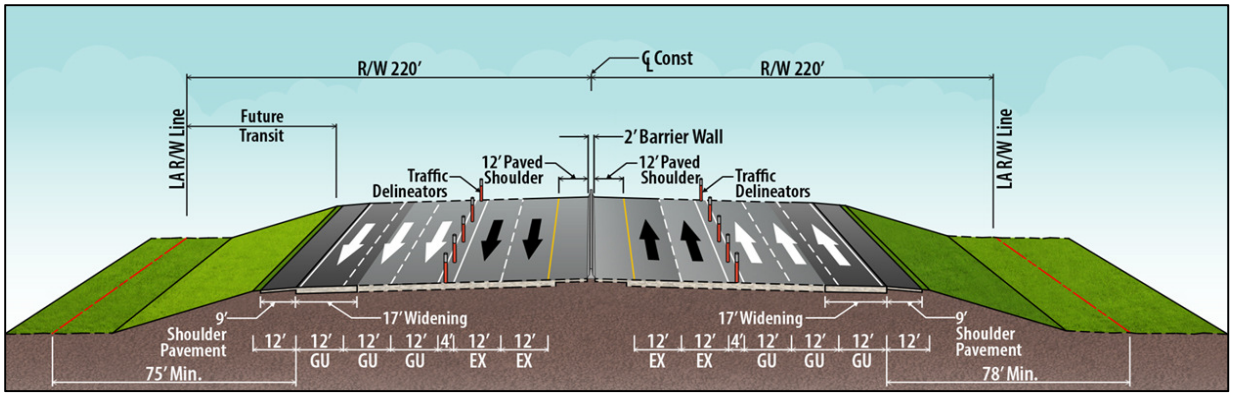

Figure 2.3c. I-275 Mainline Master Plan Build Alternative Typical Section from south of 9th Street North to north of 4th Street North (Segment C-MP3)

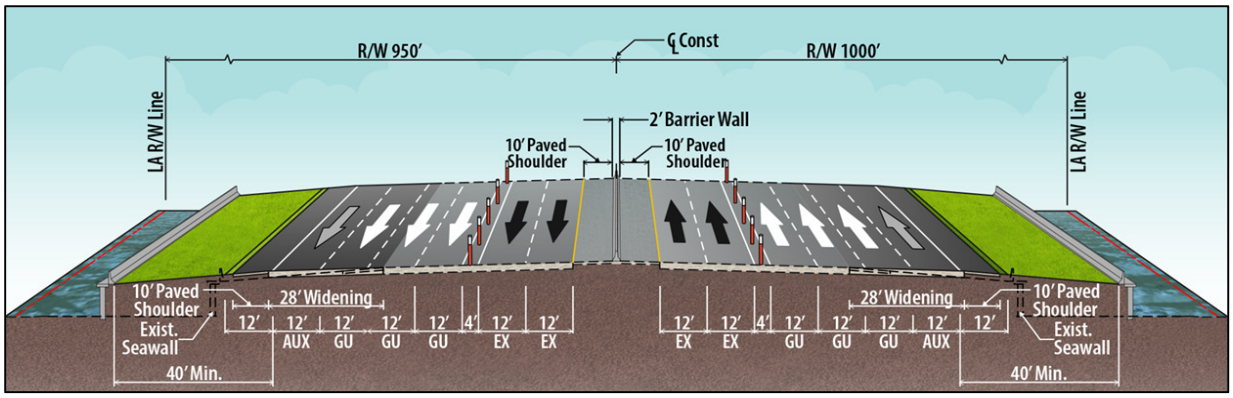

Figure 2.3d. I-275 Mainline Master Plan Build Alternative Typical Section from north of 4th Street North to 1.0 mile south of the Howard Frankland Bridge (Segment C-MP4)

2.2.3.2 Proposed Starter Project Improvements

The Starter Project improvements are similar to those of the Master Plan, with the exception that instead of two express lanes proposed in each direction of I-275 under the Master Plan Project, only one lane is provided in each direction of I-275. The southern termini of the Starter Project express lane improvements consist of a lane addition north of Gandy Boulevard, and in the southbound direction the proposed inside (i.e., towards the median) express lane transitions back into the existing southbound I-275 typical section south of Gandy Boulevard.

The Starter Plan proposes to widen the existing I-275 mainline towards the median in order to accommodate one EL in each direction from south of Gandy Boulevard to 118th Avenue North (see **Figure 2.4a** for a graphical depiction of the proposed typical section). As illustrated on **Figure 2.4b**, an MSE wall is utilized in the design of the direct connection to transition 118th Avenue flyover ramps into the at-grade I-275 mainline just south of 9th Street North. The remaining limits of the Starter Project, from north of 9th Street to 1.0 mile south of the Howard Frankland Bridge, involve outside widening and re-designating the existing auxiliary lane on I-275 to form an express lane to the inside. As shown on **Figure 2.4c** and **Figure 2.4d**, no additional travel lanes above-and-beyond the number of existing travel lanes are added under the Starter Project north of 9th Street North.

3.0 Methodology

3.1 Methodology Statement

The methodology and procedures employed to analyze and evaluate existing and future traffic operations within the I-275 study corridor are defined in the Methodology Letter of Understanding (MLOU) prepared for the I-275 Systems Interchange Modification Report (SIMR). A copy of the FHWA-approved MLOU is provided in **Appendix B.** As previously discussed, the I-275 study corridor in Pinellas County is part of the system of express lanes improvement proposed for the Tampa Bay Region and described as the TBX Master Plan Project. In order to achieve consistent, predictable, and repeatable results among the various express lane projects, a common methodology for analysis has been employed in the I-275 PD&E Study.

3.2 Analysis Years and Alternatives

The analysis years and concepts analyzed include the following:

Existing Year: 2012 (Existing Configuration)

Opening Year: 2020 (Starter Project and Lane Continuity Improvements)

Interim Year: 2030 (Starter Project and Lane Continuity Improvements)

Design Year: 2040 (Master Project, No Build, and Lane Continuity Improvements)

3.3 Data Collection and Sources

Data collection for the study consists of information from various sources, which are comprised of existing information and field-collected data. Sources of existing information include:

- Straight Line Diagrams (SLDs)
- Latest Five-Year Crash History from FDOT Crash Analysis Reporting System (C.A.R.S.)
- Traffic Count Information from the Florida Traffic Information (FTI) DVD
- FDOT Standard Indexes
- Project Traffic Forecasting Handbook
- Quality/LOS Handbook
- FDOT Five-Year Work Program
- Tampa Bay Time of Day Model
- Pinellas County MPO 2035 LRTP
- Developments of Regional Impact (DRIs)
- TBARTA Master Plan

3.4 Operational Analysis Approach

The No Build, Starter Project, and Master Project scenarios from South of Gandy Boulevard to north of 4th Street North were analyzed in CORSIM, a microsimulation software program. The Measures of Effectiveness (MOEs) used for the analysis include density and average speed. The Lane Continuity Improvements for the freeway mainline and ramps from south of 54th Avenue South to south of Gandy Boulevard were analyzed using the Highway Capacity Software (HCS) 2010, which is based on the Highway Capacity Manual (HCM) 2010 methodology. Ramp terminal intersections within the Lane Continuity Improvement limits were analyzed using Synchro HCM 2010 reports and the HCS 2010. The minimum LOS standard for freeways, ramps, and arterials is LOS D.

3.5 Transportation System Management (TSM) Considerations

Transportation System Management (TSM) improvements were considered as part of the Lane Continuity Improvements from south of 54th Avenue South to south of Gandy Boulevard. TSM improvements may include adding lanes to on and off ramps, restriping to change lane designations, signal retiming, modifying stop-controlled intersections to signalized intersections, and addition of new or lengthening of existing right/left turn lanes.

4.0 Existing Conditions

4.1 Roadway and Interchange Characteristics

I-275 is a north-south freeway that is classified as an urban principal interstate. I-275 has between two and five (including auxiliary) 12-foot lanes in each direction, with paved outside shoulders. The following fifteen interchanges exist within the project limits:

- I-275/54th Avenue South
- I-275/26th Avenue South
- I-275/22nd Avenue South
- I-275/31st Avenue South
- I-275/28th Avenue South
- I-275/I-175
- I-275/I-375
- I-275/5th Avenue North
- I-275/22nd Avenue North
- I-275/38th Avenue North
- I-275/54th Avenue North
- I-275/Gandy Boulevard
- I-275/118th Avenue North/Roosevelt Boulevard
- I-275/Ulmerton Road/9th Street North
- I-275/4th Street North

The project is approximately 16.3 miles long. The I-275 existing posted speed is 65 mph. The intersection lane geometry is shown on **Figure 4.1**. The distances between the interchanges of interest are displayed in **Table 4-1** . The milepost was approximated from the I-275 straight line diagram, which can be found in **Appendix C**. The distance between mileposts was converted and rounded to the nearest 100 feet.

4.2 Crash Data and Safety Analysis

Crash data within the I-275 project limits were obtained from the FDOT crash database for the years 2009 through 2013. A total of 2082 crashes were reported within the project limits for the years 2009 through 2013, for an average of 416 crashes per year. This translates to 26 crashes per mile per year along the 16.3 mile project corridor. **Figure 4.2** shows the total number of crashes within the

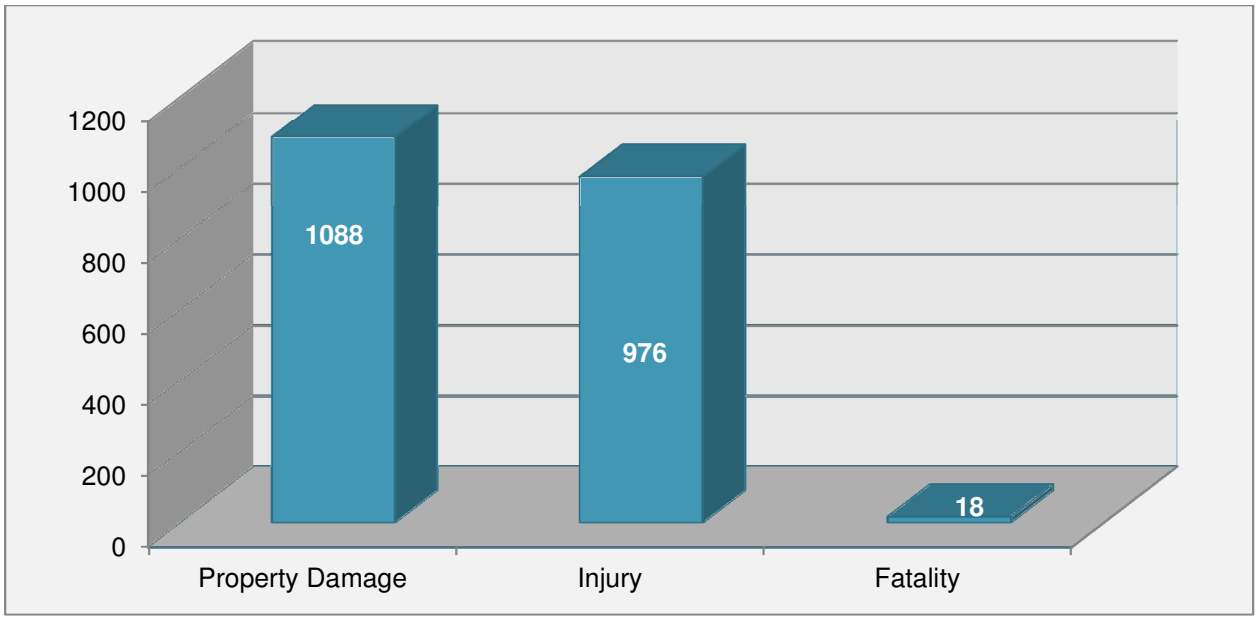

Figure 4.2. Number of Crashes involving Property Damage, Injury, or Fatality (2009-2013)

project area involving property damage, injury, or fatality. There were 1088 crashes that involved property damage, 976 crashes that involved injury, and 18 crashes that involved a fatality within the project limits for the years 2009 through 2013. Segment B had the highest total number of crashes (1149). **Figure 4.3** shows the crash totals and crash percentages by segment.

The average number of crashes for the study corridor is approximately 416 crashes per year. The crash rates along the 4.6-miles of Segment A vary from a low of 0.464 to a high of 0.901, which is greater than the average crash rate of 0.681 for similar interstate facilities. For Segment B, the crash rates vary from a low of 0.702 to 1.017, which is greater than the average crash rate of 0.681. Segment C observed crash rates lower than the average crash rate with a range of values from 0.367 to 0.615. Segments A and B typically involve a significant number of weaving and lane changing movements as drivers position their vehicles to enter or exit the I-275 mainline. Based on unit costs from the National Safety Council for 2012, the economic loss, or cost to society of these crashes, is estimated to be approximately $112.07 million over the 5 year period, as shown in **Table 4-2.**

In addition to the 2082 crashes that occurred on the mainline and ramps within the project limits, an additional 933 crashes occurred within the vicinity of several ramp terminal intersections that are within the corridor. **Figure 4.3** displays the amount of crashes per year by cross street. Only crashes that occurred within the nearest upstream and downstream intersections of the ramp terminal were included in this analysis. Gandy Boulevard had the highest total number of crashes (188) followed by 5th Avenue North (169) and Roosevelt Boulevard (168) over the 5-year period spanning from 2009 to 2013.

4.3 Data Collection

Traffic counts along the I-275 mainline from south of 54th Avenue South to north of 4th Street North and the interchange ramps within the I-275 study corridor originated from historical count information contained in the 2013 FTI DVD and supplemented with traffic data obtained from Pinellas County and recent FDOT studies, as shown in **Appendix C**. Vehicle turning movement counts were

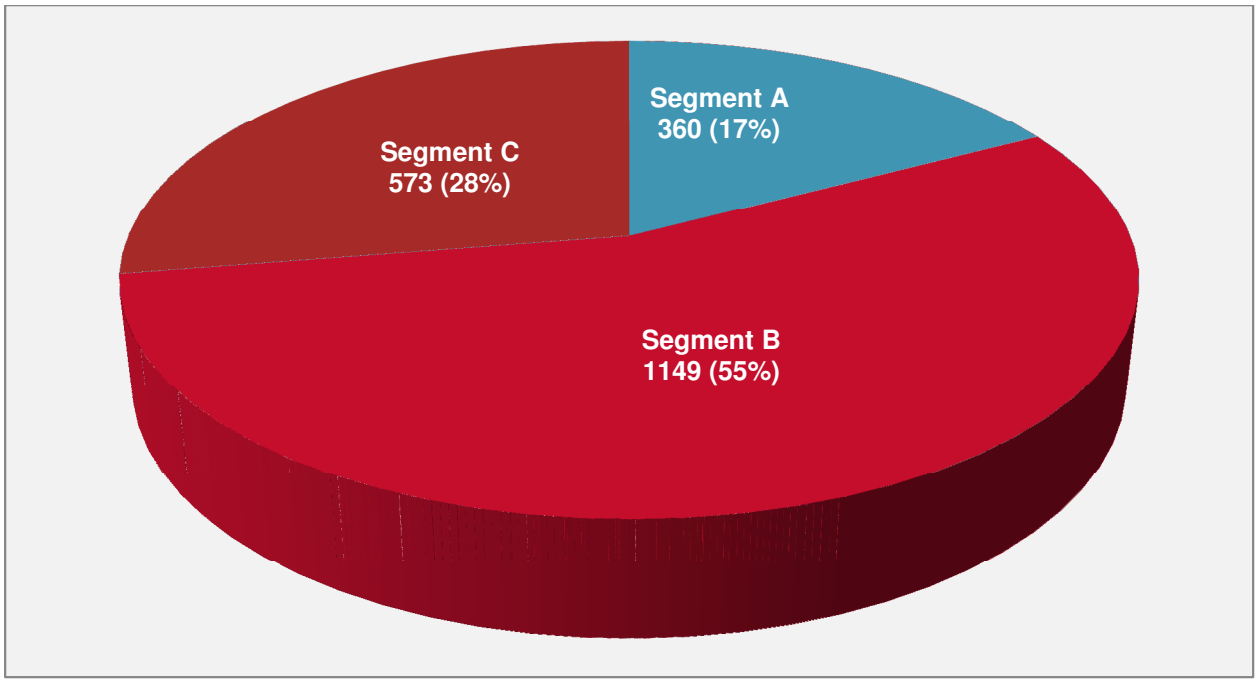

Figure 4.3. Segment Crash Frequency and Percentage

collected at all ramp terminal intersections from 7:00 AM to 9:00 AM and 4:00 PM and 6:00 PM. All turning movement counts, except for Gandy Boulevard, were collected on April 9-10, 2014. The counts for Gandy Boulevard were collected on November 15, 2012. The traffic count data can be found in **Appendix D**. The AM and PM global peak hours were determined to occur from 7:00 AM to 8:00 AM and from 4:45 PM to 5:45 PM, respectively. Travel time data collected on the I-275 mainline and vehicle queue lengths measured on the I-275 off ramps is shown in **Appendix E.** These data were used in calibrating the CORSIM model that was developed for the express lanes section of I-275 from south of Gandy Boulevard to north of 4th Street North. Signal timing plans for the signalized intersections were obtained from Pinellas County and the City of St. Petersburg. The signal timing plans can be found in **Appendix F**.

Table 4-2. Estimated Economic Loss from Crashes

Crash Type	Estimated 2012 Unit Cost	Estimated Number 2009 thru 2013*	Economic Loss
Fatality	$1,410,000	18	$25,380,000
Nonfatal Disabling Injury	$78,900	976	$77,006,400
Property Damage	$8,900	1088	$9,683,200
Total			$112,069,600

Note: *Within the project study limits

4.4 Development of Existing Year (2012) Traffic Volumes

The existing year (2012) AADT and AM and PM peak-hour traffic volumes were provided by FDOT District Seven for the I-275 mainline and ramps. **Figure 4.4** and **Figure 4.5** show the existing year (2012) AADT and AM and PM peak hour traffic volumes, respectively.

4.5 Existing Year (2012) Traffic Operational Analysis

Traffic operational analyses of the I-275 study corridor were completed for I-275 basic freeway segments, merge/diverge areas of the mainline/ramp junctions and ramp terminal intersections. The HCS 2010 was utilized to evaluate existing freeway operations on the I-275 mainline within the lane continuity section of I-275 (i.e., Segments A and B, from south of 54th Avenue South to south of Gandy Boulevard). Due to the unique traffic characteristics associated with the express lane section of I-275 (i.e., Segment C, from south of Gandy Boulevard to north of 4th Street North), CORSIM microsimulation was employed to evaluate the operations of the ELs and GULs. The AM and PM peak period CORSIM models were calibrated for use in determining existing and future traffic operations. The CORSIM Calibration Memorandum can be found in **Appendix G**. The following sections present the key MOEs obtained from the use of the HCS 2010 and CORSIM software to assess the operations of the I-275 study corridor.

4.5.1 Existing Year (2012) I-275 Mainline Operations

The I-275 mainline was analyzed in HCS 2010 using density thresholds specified in Exhibit 11-5 of the HCM 2010 to determine the LOS. The results of the existing year (2012) HCS 2010 basic freeway analysis for the AM and PM peak periods are shown in **Table 4-4** and **Table 4-5**, respectively. The results of the analysis indicate that five segments currently do not meet the adopted LOS standard in the AM peak hour and two segments currently do not meet the adopted LOS standard in the PM peak hour. The HCS 2010 freeway output for the existing year (2012) can be found in **Appendix H**.

4.5.2 Existing Year (2012) I-275 Merge/Diverge Operations

The I-275 ramp merge/diverge areas were analyzed in HCS 2010 using density thresholds specified in Exhibit 13-2 of the HCM 2010. Ramp capacities were also checked. The results of the existing year (2012) HCS 2010 ramp merge/diverge analysis for the AM and PM peak periods are shown in **Table 4-6** and **Table 4-7**, respectively. The results of the analysis indicate that nine merge/diverge areas currently do not meet the adopted LOS standards in the AM peak hour and five merge/diverge areas currently do not meet the adopted LOS standards in the PM peak hour. This may be attributed to substandard freeway operations as, the ramps all operate well under capacity as shown in **Table 4-8**. Ramp capacities are based on Exhibit 13-10 of the HCS 2010, and consider the number of lanes and free-flow speed of the ramp. The HCS ramp output for the existing year (2012) can be found in **Appendix H**.

4.5.3 Existing Year (2012) I-275 Ramp Terminal Intersection Operations

Synchro models were developed to pre-process the data used in the HCS signalized and un-signalized intersection analysis for the lane continuity improvements study area. HCM 2010 Signalized and Two-Way Stop Controlled (TWSC) intersection reports were extracted from Synchro and can be found in **Appendix H**. The results of the existing year (2012) HCS 2010 signalized ramp

terminal intersections analysis for the AM and PM peak periods are shown in **Table 4-9** and **Table 4-10**, respectively. Similarly, the results of the existing year (2012) HCS 2010 unsignalized ramp terminal intersections analysis for the AM and PM peak periods are shown in **Table 4-11** and **Table 4-12**, respectively. The results of the analysis indicate that one intersection (both signalized and unsignalized) currently does not meet the adopted LOS standards in the AM peak hour and one intersection (both signalized and unsignalized) currently do not meet the adopted LOS standards in the PM peak hour. The deficient intersection is located at Gandy Boulevard and the northbound I-275 off ramp. The northbound to eastbound right-turn lane volume is greater than the capacity that is provided by a single lane yield controlled right turn movement.

[1]Control delay reported for left-turn movement from cross street onto I-275 on ramp
[2]Overall intersection delay calculated as the weighted average delay for all intersection movements

4.5.4 Existing Year (2012) CORSIM Analysis

The I-275 freeway operations of the existing configuration from south of Gandy Boulevard to north of 4th Street North were analyzed in CORSIM. The on and off ramps within these limits were also analyzed. The CORSIM model was calibrated using volume as the primary parameter and travel time as the secondary parameter. A visual inspection of the queuing patterns was also performed as part of the calibration process. The model assumptions, parameters, and network coding techniques used in developing the CORSIM models, full calibration procedure, link-node and lane diagram of the existing configuration CORSIM model, and results of the model calibration are presented in the CORSIM Calibration Memorandum, which can be found in **Appendix G**.

A three-hour multiple-period analysis was performed to ensure that congestion was not building before the peak hour or remaining after the peak hour. Each run was divided into twelve fifteen-minute time periods. The hour preceding the peak hour was comprised of time periods one through four, the peak hour was comprised of time periods five through eight, and the hour succeeding the peak hour was comprised of time periods nine through twelve. The volumes of the hours adjacent to the peak hour were determined by applying a factor to the peak-hour volumes in order to proportionately scale the balanced peak-hour volumes.

FTI synopsis data was used to determine global scale factors for both the AM and PM peak periods. The scale factors were determined by the ratio of adjacent peak-hour volumes to actual peak-hour volumes and weighting those ratios by the peak-hour volumes in order to obtain one overall global ratio. Scale factors of 0.76 and 0.89 were used for the adjacent hour before the peak hour for the AM and PM peak period, respectively, and scale factors of 0.83 and 0.82 were used for the adjacent hour after the peak hour for the AM and PM peak period, respectively. All three analysis hours were adjusted by the peak-hour factor of 0.95 to account for the variability in flow rate within the four fifteen-minute periods of each of the three hours.

Ten different model runs were performed for both the AM and PM peak periods to ensure that a variety of random occurrences that could result from the stochastic nature of the program were captured and to ensure that an appropriate sample size was used to average the output results for each MOE. The peak-hour results for different MOEs, measured at one-minute intervals, were extracted from the existing year (2012) CORSIM model output and averaged over the ten runs for the appropriate links. Note that the peak-hour output was used for determining the operational analysis. The three-hour analysis period results were used to produce heat diagrams, as shown in **Appendix H**.

Also note that microsimulation programs calculate MOEs based on stochastic formulas and real-time vehicle interaction. They aggregate data output using different methods than the HCM 2010. Therefore, it is not appropriate to report LOS for MOEs extracted from simulation software programs. Comparisons and conclusions will be based on absolute differences and percent differences. The results of the existing year (2012) CORSIM analysis for the AM and PM peak periods are shown in **Table 4-13**.

5.0 Future Travel Demand

5.1 Tampa Bay Time of Day Model

The Tampa Bay Time of Day (TBTOD) Model with express lanes included was developed from the Tampa Bay Regional Planning Model (TBRPM) and used as a source to forecast future year (2020, 2030, and 2040) traffic projections within the I-275 PD&E study limits. The Model's validated Base Year is 2006 and the most-recently adopted Cost Affordable (CA) model has a Horizon Year of 2035. The Tampa Bay Regional Planning Model is based on the Florida Standard Urban Transportation Modeling Structure (FSUTMS) and is recognized by the FDOT as the accepted travel demand forecasting model for Pinellas County. The travel demand forecast methodology statement is shown in **Appendix I**.

5.2 Development of Design Year (2040) Traffic Volumes

The design year (2040) AADT and Directional Design Hour Volumes (DDHV) on the freeway and ramps were provided by FDOT as developed from the TBTOD Model. The design year (2040) DDHV on the ramps were multiplied by the turning movement percentages at the ramp terminals. The ramp volumes that were provided were held constant as the control and a manual smoothing process was performed to balance traffic flows along the arterial between the ramp terminal intersections. **Figure 5.1** and **Figure 5.2** show the design year (2040) No Build AADT and AM and PM DDHV, respectively. **Figure 5.3** and **Figure 5.4** show the design year (2040) Master Project AADT and AM and PM DDHV, respectively.

5.3 Development of Opening Year (2020) and Interim Year (2030) Traffic Volumes

The opening year (2020) and interim year (2030) AADT and DDHV on the freeway and ramps were provided by FDOT as developed from the TBTOD Model. The turning movement volumes at the ramp terminals were adjusted proportionately to balance with the ramp volumes that were provided. The arterial through volumes were developed by interpolating between the existing year (2012) and design year (2040) arterial DDHV. **Figure 5.5** and **Figure 5.6** show the opening year (2020) Starter Project AADT and AM and PM DDHV, respectively. **Figure 5.7** and **Figure 5.8** show the interim year (2030) Starter Project AADT and AM and PM DDHV, respectively.

5.4 Noise Traffic Data

Noise traffic data was collected along I-275 for use in determining if it would be necessary for noise walls to be constructed due to the impacts of the proposed improvements. Traffic data required to conduct the noise analysis of the proposed improvements is provided in **Appendix J**.

6.0 Design Year (2040) Traffic Operational Analysis

Traffic operational analyses of the I-275 study corridor were completed for I-275 basic freeway segments, merge/diverge areas of the mainline/ramp junctions and ramp terminal intersections. The HCS 2010 was utilized to evaluate existing freeway operations on the I-275 mainline within the lane continuity section of I-275 (i.e., Segments A and B, from south of 54th Avenue South to south of Gandy Boulevard). Due to the unique traffic characteristics associated with the express lane section of I-275 (i.e., Segment C, from south of Gandy Boulevard to north of 4th Street North), CORSIM microsimulation was employed to evaluate the operations of the ELs and GULs.

6.1 No Build

The No Build Alternative assumes that, with the exception of the improvements that are already planned and funded, the existing conditions would remain for I-275 within the project limits. Intersection lane geometry is shown on **Figure 6.1**. The distances between the interchanges of interest are displayed in **Table 4-1**. The following sections present the key MOEs obtained from the use of the HCS 2010 and CORSIM to assess the operations of the I-275 study corridor. In addition to existing lane geometry, projects currently programmed in FDOT work program such as Gandy Boulevard FPID: 257086-1-52-01 were considered in the No Build Alternative.

6.1.1 Design Year (2040) I-275 Mainline Operations

The I-275 mainline was analyzed in HCS 2010 using density thresholds specified in Exhibit 11-5 of the HCM 2010 to determine the LOS. The results of the design year (2040) HCS 2010 basic freeway analysis for the AM and PM peak periods are shown in **Table 6-1** and **Table 6-2**, respectively. The results of the analysis indicate that twenty-five segments are not projected to meet the adopted LOS standards in the AM peak hour and twenty segments are not projected to meet the adopted LOS standards in the PM peak hour. The HCS 2010 freeway output for the design year (2040) can be found in **Appendix K**.

6.1.2 Design Year (2040) I-275 Merge/Diverge Operations

The I-275 ramp merge/diverge areas were analyzed in HCS 2010 using density thresholds specified in Exhibit 13-2 of the HCM 2010. Ramp capacities were also checked. The results of the design year (2040) HCS 2010 ramp merge/diverge analysis for the AM and PM peak periods are shown in **Table 6-3** and **Table 6-4**, respectively. The results of the analysis indicate that thirty-one merge/diverge areas are not projected to meet the adopted LOS standards in the AM peak hour and twenty-eight merge/diverge areas are not projected to meet the adopted LOS standards in the PM peak hour. This may be attributed to substandard freeway operations as, the ramps all operate well under capacity as shown in **Table 6-5**. The HCS ramp output for the design year (2040) can be found in **Appendix K**.

Table 6-3. Design Year (2040) No Build I-275 Ramp MOEs and LOS – AM Peak Hour

6.1.3 Design Year (2040) I-275 Ramp Terminal Intersection Operations

Synchro models were developed for the Lane Continuity study area for the AM and PM peak periods for the operational analysis of the I-275 ramp terminal intersections. HCM 2010 Signalized and TWSC intersection reports were extracted from Synchro and can be found in **Appendix K**. The results of the design year (2040) HCS 2010 signalized ramp terminal intersections analysis for the AM and PM peak periods are shown in **Table 6-6** and **Table 6-7**, respectively. Similarly, the results of the design year (2040) HCS 2010 unsignalized ramp terminal intersections analysis for the AM and PM peak periods are shown in **Table 6-8** and **Table 6-9**, respectively. The results of the analysis indicate that nine intersections (both signalized and unsignalized) are not projected to meet the adopted LOS standard in the AM peak hour and nine intersections (both signalized and unsignalized) are not projected to meet the adopted LOS standard in the PM peak hour. Based on the TWSC analysis results, the 31st south ramp terminal intersection may be a candidate for signalization.

6.1.4 Design Year (2040) CORSIM Analysis

The I-275 freeway operations of the existing configuration from south of Gandy Boulevard to north of 4th Street were analyzed in CORSIM. The on and off ramps within these limits were also analyzed. The parameters used in the calibrated CORSIM models were used in the design year (2040) Models and the modeling procedure described in Section 2.5.4 was employed. The link-node and lane diagram for the No Build CORSIM model is shown in **Appendix K**. The peak-hour results for different MOEs were extracted from the design year (2040) CORSIM model output and averaged over the ten runs for the appropriate links and time periods. Note that the peak-hour output was used for determining the operational analysis. The three-hour analysis period results were used to produce heat diagrams, as shown in **Appendix K**. The results of the design year (2040) CORSIM analysis for the AM and PM peak periods are shown in **Table 6-10**.

6.2 Master Project

The Master Project proposes to widen the existing I-275 mainline towards the median in order to accommodate one EL in each direction from south of Gandy Boulevard to 118th Avenue North. Direct connections from the 118th Avenue North/Gateway corridor to I-275 are provided via new flyover ramps that enter and exit I-275 from the median. From 118th Avenue North to north of 4th Street North, two express lanes are provided in each direction of travel along I-275. Intersection lane geometry is shown on **Figure 6.2**. The distances between the interchanges of interest are displayed in **Table 4-1**. The following sections present the key MOEs obtained from the use of the HCS 2010 and CORSIM to assess the operations of the I-275 study corridor.

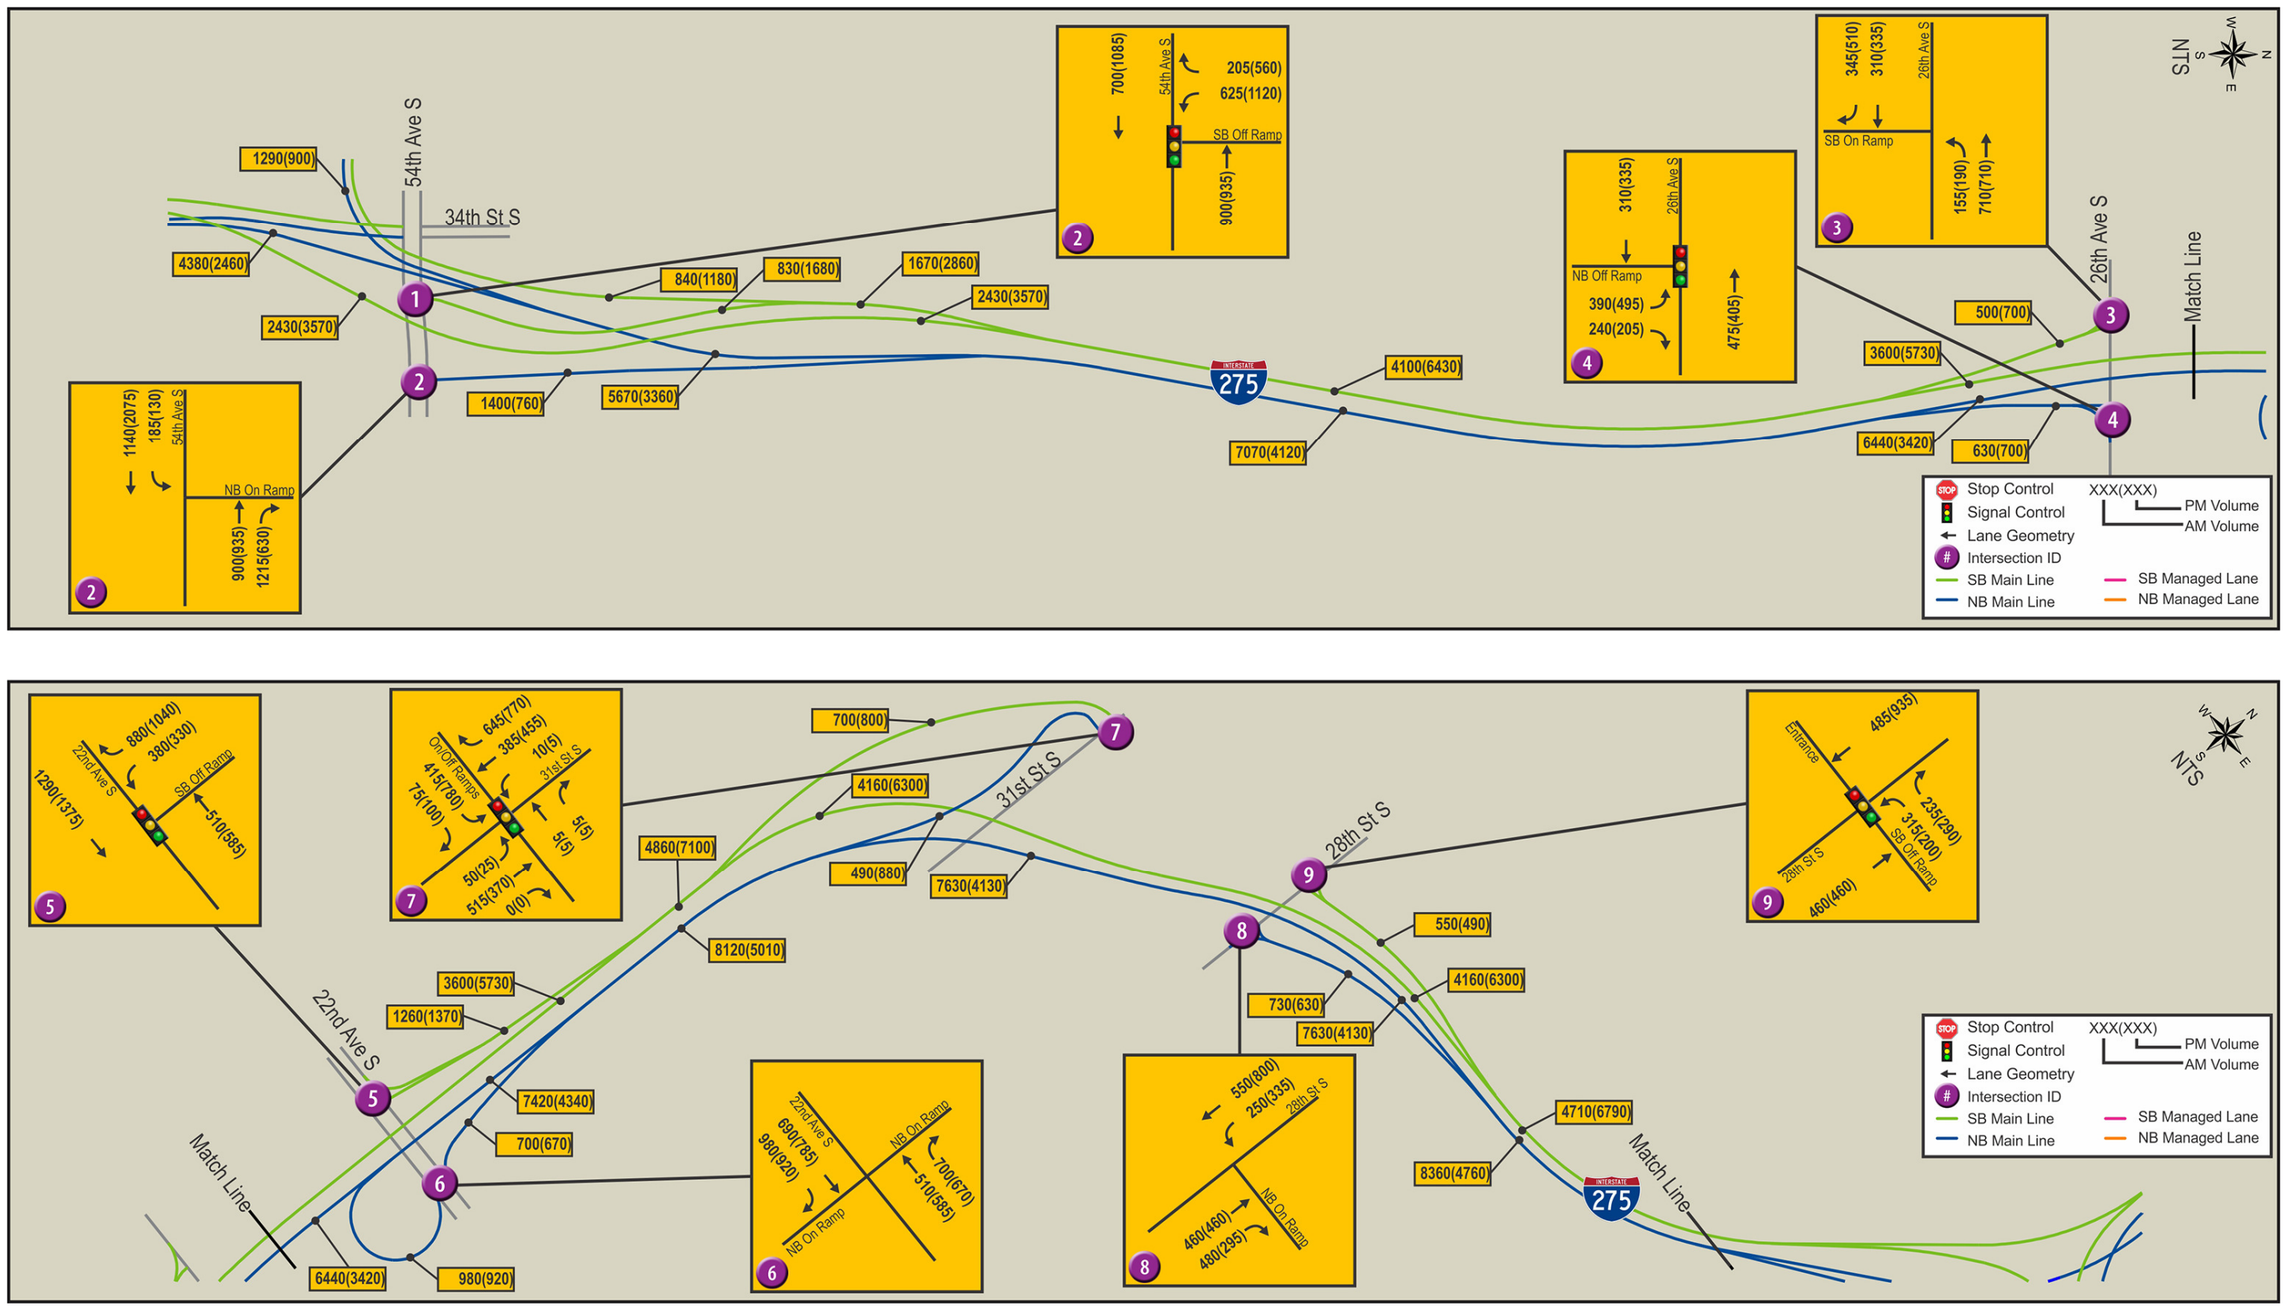

Figure 6.2. Master Project Lane Geometry

6.2.1 Design Year (2040) I-275 Mainline Operations

The I-275 mainline was analyzed in HCS 2010 using density thresholds specified in Exhibit 11-5 of the HCM 2010 to determine the LOS. The results of the design year (2040) HCS 2010 basic freeway analysis for the AM and PM peak periods are shown in **Table 6-11** and **Table 6-12**, respectively. The results of the analysis indicate that twenty-four segments are not projected to meet the adopted LOS standards in the AM peak hour and eighteen segments are not projected to meet the adopted LOS standards in the PM peak hour. The HCS 2010 freeway output for the design year (2040) can be found in **Appendix K**.

Table 6-11. Design Year (2040) Build I-275 Mainline MOEs and LOS – AM Peak Hour

6.2.2 Design Year (2040) I-275 Merge/Diverge Operations

The I-275 ramp merge/diverge areas were analyzed in HCS 2010 using density thresholds specified in Exhibit 13-2 of the HCM 2010. Ramp capacities were also checked. The results of the design year (2040) HCS 2010 ramp merge/diverge analysis for the AM and PM peak periods are shown in **Table 6-13** and **Table 6-14**, respectively. The results of the analysis indicate that twenty-nine merge/diverge areas are not projected to meet the adopted LOS standards in the AM peak hour and twenty-seven merge/diverge areas are not projected to meet the adopted LOS standards in the PM peak hour. This may be attributed to substandard freeway operations as, the ramps all operate well under capacity as shown in **Table 6-15**. The HCS ramp output for the design year (2040) can be found in **Appendix K**.

6.2.3 Design Year (2040) I-275 Ramp Terminal Intersection Operations

Synchro models were developed for the Lane Continuity study area for the AM and PM peak periods for the operational analysis of the I-275 ramp terminal intersections. The Build Alternative assume lane geometry and traffic control improvements shown on **Figure 6.2**. HCM 2010 Signalized and TWSC intersection reports were extracted from Synchro and can be found in **Appendix K**. The results of the design year (2040) HCS 2010 signalized ramp terminal intersections analysis for the AM and PM peak periods are shown in **Table 6-16** and **Table 6-17**, respectively. Similarly, the results of the design year (2040) HCS 2010 unsignalized ramp terminal intersections analysis for the AM and PM peak periods are shown in **Table 6-18** and **Table 6-19**, respectively. The results of the

analysis indicate that all intersections (both signalized and unsignalized) are projected to meet the adopted LOS standard in the AM peak hour and two intersections (both signalized and unsignalized) are not projected to meet the adopted LOS standard in the PM peak hour.

6.2.4 Design Year (2040) CORSIM Analysis

The I-275 freeway from south of Gandy Boulevard to north of 4th Street North was analyzed in CORSIM with the Master Project implemented. The on and off ramps within these limits were also analyzed. The parameters used in the calibrated CORSIM models were used in the design year (2040) Models and the modeling procedure described in Section 2.5.4 were employed. The link-node and lane diagram for the Master Project CORSIM model is shown in **Appendix K**. The peak-hour results for different MOEs were extracted from the design year (2040) CORSIM model output and averaged over the ten runs for the appropriate links and time periods. Note that the peak-hour output was used for determining the operational analysis. The three-hour analysis period results were used to produce heat diagrams, as shown in **Appendix K**. The results of the design year (2040) CORSIM analysis for the AM and PM peak periods are shown in **Table 6-20**.

7.0 Opening Year (2020) Traffic Operational Analysis

Traffic operational analyses of the I-275 study corridor were completed for I-275 basic freeway segments, and merge/diverge areas of the mainline/ramp junctions. The HCS 2010 was utilized to evaluate existing freeway operations on the I-275 mainline within the lane continuity section of I-275 (i.e., Segments A and B, from south of 54th Avenue South to south of Gandy Boulevard). Due to the unique traffic characteristics associated with the express lane section of I-275 (i.e., Segment C, from south of Gandy Boulevard to north of 4th Street North), CORSIM microsimulation was employed to evaluate the operations of the ELs and GULs.

7.1 Starter Project

The Starter Project improvements are similar to those of the Master Project, with the exception that instead of two express lanes proposed in each direction of I-275, only one lane is provided in each direction of I-275. The southern termini of the Starter Project express lane improvements consist of a direct connection from the 118th Avenue North/Gateway corridor to northbound I-275 via a flyover on ramp and in the southbound direction the proposed inside (i.e., towards the median) express lane transitions back into the existing southbound I-275 typical section south of 118th Avenue. The remaining limits of the Starter Project, from north of 9th Street to north of 4th Street North, involve only re-designating the existing auxiliary lane on I-275 to form an express lane to the inside. No additional travel lanes above-and-beyond the number of existing travel lanes are added under the Starter Project north of 9th Street North. Intersection lane geometry is shown on **Figure 7.1**. The distances between the interchanges of interest are displayed in **Table 4-1**. The following sections present the key MOEs obtained from the use of the HCS 2010 and CORSIM to assess the operations of the I-275 study corridor.

7.1.1 Opening Year (2020) I-275 Mainline Operations

The I-275 mainline was analyzed in HCS 2010 using density thresholds specified in Exhibit 11-5 of the HCM 2010 to determine the LOS. The results of the opening year (2020) HCS 2010 basic freeway analysis for the AM and PM peak periods are shown in **Table 7-1** and **Table 7-2**, respectively. The results of the analysis indicate that eight segments are not projected to meet the adopted LOS standards in the AM peak hour and three segments are not projected to meet the adopted LOS standards in the PM peak hour. The HCS 2010 freeway output for the opening year (2020) can be found in **Appendix L**.

7.1.2 Opening Year (2020) I-275 Merge/Diverge Operations

The I-275 ramp merge/diverge areas were analyzed in HCS 2010 using density thresholds specified in Exhibit 13-2 of the HCM 2010. Ramp capacities were also checked. The results of the opening year (2020) HCS 2010 ramp merge/diverge analysis for the AM and PM peak periods are shown in **Table 7-3** and **Table 7-4**, respectively. The results of the analysis indicate that thirteen merge/diverge areas are not projected to meet the adopted LOS standard in the AM peak hour and five merge/diverge areas are not projected to meet the adopted LOS standard in the PM peak hour. This may be attributed to substandard freeway operations as, the ramps all operate well under capacity as shown in **Table 7-5**. The HCS ramp output for the opening year (2020) can be found in **Appendix L**.

7.1.3 Opening Year (2020) CORSIM Analysis

The I-275 freeway from south of Gandy Boulevard to north of 4th Street was analyzed in CORSIM with the Starter Project implemented. The on and off ramps within these limits were also analyzed. The parameters used in the calibrated CORSIM models were used in the opening year (2020) Models and the modeling procedure described in Section 2.5.4 was employed. The link-node and lane diagram for the Starter Project CORSIM model is shown in **Appendix L**. The peak-hour results for different MOEs were extracted from the opening year (2020) CORSIM model output and averaged over the ten runs for the appropriate links and time periods. Note that the peak-hour output was used for determining the operational analysis. The three-hour analysis period results were used to produce heat diagrams, as shown in **Appendix L**. The results of the opening year (2020) CORSIM analysis for the AM and PM peak periods are shown in **Table 7-6**.

8.0 Interim Year (2030) Traffic Operational Analysis

Traffic operational analyses of the I-275 study corridor were completed for I-275 basic freeway segments, and merge/diverge areas of the mainline/ramp junctions. The HCS 2010 was utilized to evaluate existing freeway operations on the I-275 mainline within the lane continuity section of I-275 (i.e., Segments A and B, from south of 54th Avenue South to south of Gandy Boulevard). Due to the unique traffic characteristics associated with the express lane section of I-275 (i.e., Segment C, from south of Gandy Boulevard to north of 4th Street North), CORSIM microsimulation was employed to evaluate the operations of the ELs and GULs.

8.1 Starter Project

The Starter Project improvements are similar to those of the Master Project, with the exception that instead of two express lanes proposed in each direction of I-275, only one lane is provided in each direction of I-275. The southern termini of the Starter Project express lane improvements consist of a direct connection from the 118th Avenue North/Gateway corridor to northbound I-275 via a flyover on ramp and in the southbound direction the proposed inside (i.e., towards the median) express lane transitions back into the existing southbound I-275 typical section south of 118th Avenue. The remaining limits of the Starter Project, from north of 9th Street to north of 4th Street North, involve only re-designating the existing auxiliary lane on I-275 to form an express lane to the inside. No additional travel lanes above-and-beyond the number of existing travel lanes are added under the Starter Project north of 9th Street North. The following sections present the key MOEs obtained from the use of the HCS 2010 and CORSIM to assess the operations of the I-275 study corridor.

8.1.1 Interim Year (2030) I-275 Mainline Operations

The I-275 mainline was analyzed in HCS 2010 using density thresholds specified in Exhibit 11-5 of the HCM 2010 to determine the LOS. The results of the interim year (2030) HCS 2010 basic freeway analysis for the AM and PM peak periods are shown in **Table 8-1** and **Table 8-2**, respectively. The results of the analysis indicate that eighteen segments are not projected to meet the adopted LOS standard in the AM peak hour and nine segments are not projected to meet the adopted LOS standard in the PM peak hour. The HCS 2010 freeway output for the interim year (2030) can be found in **Appendix M**.

8.1.2 Interim Year (2030) I-275 Merge/Diverge Operations

The I-275 ramp merge/diverge areas were analyzed in HCS 2010 using density thresholds specified in Exhibit 13-2 of the HCM 2010. Ramp capacities were also checked. The results of the interim year (2030) HCS 2010 ramp merge/diverge analysis for the AM and PM peak periods are shown in **Table 8-3** and **Table 8-4**, respectively. The results of the analysis indicate that sixteen merge/diverge areas are not projected to meet the adopted LOS standard in the AM peak hour and twelve

merge/diverge areas are not projected to meet the adopted LOS standard in the PM peak hour. This may be attributed to substandard freeway operations as, the ramps all operate well under capacity as shown in **Table 8-5**. The HCS ramp output for the interim year (2030) can be found in **Appendix M**.

8.1.3 Interim Year (2030) CORSIM Analysis

The I-275 freeway from south of Gandy Boulevard to north of 4th Street was analyzed in CORSIM with the Starter Project implemented. The on and off ramps within these limits were also analyzed. The parameters used in the calibrated CORSIM models were used in the interim year (2030) models and the modeling procedure described in Section 2.5.4 was employed. The link-node and lane diagram for the Starter Project CORSIM model is shown in **Appendix M**. The peak-hour results for different MOEs were extracted from the interim year (2030) CORSIM model output and averaged over the ten runs for the appropriate links and time periods. Note that the peak-hour output was used for determining the operational analysis. The three-hour analysis period results were used to produce heat diagrams, as shown in **Appendix M**. The results of the interim year (2030) CORSIM analysis for the AM and PM peak periods are shown in **Table 8-6**.

9.0 Conclusions

This DTTM is as a component of the I-275 PD&E Study from south of 54th Avenue South to north of 4th Street North in Pinellas County, Florida. The purpose of the DTTM was to evaluate existing and future traffic operations of the I-275 study corridor in order to define the lane geometry and traffic control features needed to meet adopted LOS standards in the design year (2040). HCS analyses were employed to analyze the proposed lane continuity improvements from south of 54th Avenue North to Gandy Boulevard, while microsimulation using CORSIM was employed to analyze the proposed Master and Starter express lane projects from south of Gandy to the northern study limit 1.0 mile south of the Howard Frankland Bridge. The key findings from this analysis are summarized below.

Existing (2012)

- Majority of I-275 mainline segments operate at LOS D or better in the AM and PM peak hours, except for the segment from 22nd Avenue North to Gandy Boulevard which operates at LOS E.

Design Year (2040)

- The No Build analysis indicates that almost all freeway segments, ramp merge/diverge locations, and ramp terminal intersections are projected to operate at failing LOS if no improvements are made.
- The lane continuity improvement provide a marked improvement in operating conditions when compared to the no build, but do not fully resolve all mainline, ramp, and intersection deficiencies.
- All general-use and special-use lanes on I-275 are projected to operate satisfactorily with the proposed express lanes.
- Ramp terminal intersection improvements are needed to provide the necessary level of operations.
- Operational deficiencies on the mainline, ramps, and intersections beyond the design year (2040) will be addressed as needed in future studies.

Opening Year (2020)

- The Starter Project will provide acceptable mainline operations within the express lane section of I-275.

Interim Year (2030)

- Improvements above and beyond the Starter Project will be needed in the interim year 2030.

TABLE OF CONTENTS

Section **Page**

1.0 INTRODUCTION AND PROJECT DESCRIPTION 1-1
- 1.1 INTRODUCTION/BACKGROUND
- 1.2 PURPOSE AND NEED
- 1.3 PROJECT LOCATION
- 1.4 AREA OF INFLUENCE
- 1.5 PROJECT SCHEDULE

2.0 ANALYSIS YEARS 2-1
- 2.1 FOR TRAFFIC FORECASTING
- 2.2 FOR TRAFFIC OPERATIONAL ANALYSIS

3.0 ALTERNATIVES 3-1

4.0 DATA COLLECTION 4-1
- 4.1 TRANSPORTATION SYSTEM DATA
- 4.2 EXISTING AND HISTORICAL TRAFFIC DATA
- 4.3 LAND USE DATA
- 4.4 ENVIRONMENTAL DATA
- 4.5 PLANNED AND PROGRAMMED PROJECTS

5.0 TRAVEL DEMAND FORECASTING 5-1
- 5.1 SELECTED TRAVEL DEMAND MODEL
- 5.2 PROJECT TRAFFIC FORECAST DEVELOPMENT
- 5.3 VALIDATION
- 5.4 ADJUSTMENT PROCEDURES
- 5.5 TRAFFIC FACTORS

6.0 TRAFFIC OPERATIONS ANALYSIS 6-1
- 6.1 EXISTING AREA TYPE/TRAFFIC CONDITIONS
- 6.2 TRAFFIC ANALYSIS SOFTWARE
- 6.3 CALIBRATION
- 6.4 MEASURES OF EFFECTIVENESS

7.0 SAFETY ANALYSIS 7-1

8.0 PLAN CONSISTENCY 8-1

9.0 ENVIRONMENTAL CONSIDERATIONS 9-1

10.0 COORDINATION 10-1

11.0 ANTICIPATED DESIGN EXCEPTIONS AND VARIATIONS 11-1

12.0 CONCEPTUAL SIGNING PLAN 12-1

13.0 ACCESS MANAGEMENT PLAN 13-1

14.0 FHWA POLICY POINTS 14-1

15.0 MLOU CONCURRENCE 15-1

APPENDICES

APPENDIX A- Tentative Project Schedule

APPENDIX B- Build Alternative Concepts
- B-1 Starter Network Geometry (Analysis years 2020 and 2030)
- B-2 Master Plan Network Geometry (Analysis year 2040)
- B-3 Refined Concept

APPENDIX C- Tampa Bay Express Master Plan Traffic Forecasts

APPENDIX D- Correspondence
- MLOU Review Comments and Responses
- MLOU Review Meeting Minutes

Section 1.0
INTRODUCTION AND PROJECT DESCRIPTION

1.1 INTRODUCTION/BACKGROUND

The Final Environmental Impact Statement (FEIS) prepared for the Tampa Interstate Study (TIS) and approved by the Federal Highway Administration (FHWA) in January 1997, documents the need for multi-lane improvements on Interstate 275 (I-275) from the east end of the Howard Frankland Bridge to Dr. Martin Luther King, Jr. Boulevard and on Interstate 4 from I-275 to 50th Street. The ultimate improvements for the I-275 corridor consist of a four-roadway system with a local freeway on the outside and an express freeway on the inside. The improvements documented in the FEIS also include modifications to the existing interchanges along I-275, which are detailed in the I-275 Systems Interchange Modification Report (SIMR) completed in 2001. These modifications are needed to improve the geometrics of the existing interchanges (e.g., ramp acceleration/deceleration lane lengths, vertical profiles, etc.) as well as to improve the traffic operations on mainline I-275.

The following is a chronology of the planning/design/construction milestones for the interstate within this study area:

CHRONOLOGY OF PLANNING, DESIGN AND CONSTRUCTION MILESTONES FOR THE I-275/SR 60 INTERCHANGE

1987-1997:

The TIS Master Plan project included multi-lane improvements to approximately 36.6 miles of interstate and freeway including I-275 from the Howard Frankland Bridge to north of the I-275/I-75 Apex and I-4 from the Downtown Interchange to east of I-75.

Following approval of the Master Plan, the Florida Department of Transportation (FDOT) initiated the Project Development and Environment (PD&E)/NEPA process for a portion of the Master Plan under the TIS FEIS. This document included the I-275/SR 60 interchange, south of Cypress Street. Improvements on SR 60 north of Cypress Street (The Tampa Airport Interchanges Project) were documented under the Northwest Expressway EIS and subsequent reevaluations.

During the PD&E/NEPA process for the TIS FEIS, the Master Plan concept adopted in 1989 evolved and incorporated modifications to accommodate new legislation, public sentiment, competing transportation priorities, and funding constraints. On January 31, 1997, a Record of Decision was received for the "selected" portions of the TIS Final Environmental Impact Study (FEIS) identified in the 2015 LRTP, which was adopted December 5, 1995. Remaining portions of the build out of the TIS FEIS (including the I-275/SR 60 interchange) were designated as the

"Preferred Alternative". The geometry contained in the 2001 SIMR was part of the TIS set of plans approved in 1997. Most of these improvements are capacity improvements.

1998-2010:

An SIMR was prepared to document capacity and ramping improvements to I-275 from the Howard Frankland Bridge to Ashley Street in 2001. These improvements included refinements to the TIS FEIS and provided capacity enhanced General Purpose Lanes, as an initial stage for construction of the Preferred Alternative to the TIS FEIS. An Interchange Operations Analysis Report (IOAR) was prepared in 2008 for revised ramping for the northbound exits to SR 60. FDOT and FHWA concurrence of these documents led to construction funding.

An Interchange Improvement Prioritization Study was completed in 2008. The purpose of this study was to rank and prioritize individual interchange improvement projects for staged construction of the interchange. The following needs were identified as key priorities:

- Additional capacity for northbound and southbound I-275,
- Additional capacity for the northbound I-275 to westbound SR 60 movement, and
- Improved operations for the eastbound SR 60 to northbound I-275 movement (loop replacement).

Given the benefit and costs studied, the study recommended that an alternative providing additional capacity to the northbound I-275 to westbound SR 60 movement be prioritized for the next stage of construction.

The recommendations from this study were then expanded into the **Ultimate Analysis Report**, completed in October of 2009, which evaluated two potential reconfigurations of the ultimate geometry for the I-275/SR 60 interchange relative to the currently approved TIS Final Environmental Impact Statement (FEIS) configuration.

2011- 2012

As part of line and grade development for the interchange, a **Design Refinement Study** was completed in September 2011. This design project refined the recommended concepts from previous studies, based on Traffic Control Plan (TCP), stage construction, and interim and future operations. This study included the following modifications to the preferred TIS plan:

- A dual lane flyover to the northbound I-275 to westbound SR 60 movement and connection of this flyover to both SR 60 express and general use lanes.

- Replacement of Express Lanes connections to Kennedy Boulevard with express lane connections toward the I-275 Howard Frankland Bridge, not included in the TIS FEIS.

- The addition of General Purpose capacity from two to three lanes in each direction on I-275 through the SR 60 interchange

Two construction projects have started, that will deliver more capacity to/from the I-275/SR 60 interchange:

- A $217M design-build contract was awarded in 2011 and construction began in July 2012 for the widening and reconstruction of I-275 from east of the I-275/SR 60 Interchange to the Hillsborough River. This project will incorporate most of the improvements to I-275 east of the SR 60 interchange contained in the 2001 SIMR. This I-275 reconstruction project is anticipated to be completed in 2016.

- The capacity of the SR 589/Veterans Expressway that connects to SR 60, Memorial Highway, the Courtney Campbell Causeway and Tampa International Airport is being doubled. Eleven miles will be widened from 4 to 8 lanes to add one through toll lane and one dynamically priced express lane in each direction between Memorial Highway/CR 576 and CR 685A/Van Dyke Road. The investment of $386M includes the conversion to All-Electronic Tolling, removing traffic impediments associated with cash toll collection.

2012- 2014

There are three major ongoing activities that will have a significant impact on the development of the I-275/SR 60 Interchange:

- The Department's 2013 Tolling Directive requires consideration of tolling on new capacity lanes added to the interstate be tolled will require reconfiguring of the transitional area of I-275 between the Howard Frankland Bridge and SR 60 to accommodate express lanes.

- The regional Tampa Bay Express Master Plan is currently under development by District 7. The Master Plan defines Ultimate and Starter Projects for I-275, I-75 and I-4 in Hillsborough and Pinellas County. Current options under consideration that could influence the interchange configuration include:

    - The use of delineators and stripes in lieu of barriers and shoulders to separate traffic to add capacity. The type of traffic separators has not been decided yet. It will be determined based FDOT Central Office guidance and coordination with FDOT District Seven.

    - Consideration of direct access between the surface street system and express lanes

Continuing/Upcoming Activities (2014-2016):

- Completion of the Tampa Bay Express (TBX) Master Plan in 2015.

- I-275/SR 60 SIMR Update

- Complete Reevaluation of TIS FEIS for I-275/SR 60 interchange

As it has been thirteen years since the 2001 SIMR has been approved and several interstate managed lanes studies are currently underway, this document serves as the Methodology Letter of Understanding (MLOU) between FHWA, FDOT's Office of Systems Planning (i.e., the Central Office) and FDOT's District Seven Interchange Review Team regarding the update of the 2001 SIMR for I-275 from the Howard Frankland Bridge to the Hillsborough River in Hillsborough County, Florida.

FDOT District Seven is the requestor for this MLOU and it shall serve as the outline for the SIMR update documenting the alternatives analysis. This MLOU is developed in accordance with the "Interchange Access Request User's Guide", FDOT Systems Planning Office, 2013.

The SIMR will be prepared in accordance with FDOT and FHWA's recommended format and will specifically address each of the following eight federal requirements, summarized from the Federal Register dated August 27, 2009:

1. *Existing system, even with reasonable improvements, is incapable of satisfactorily accommodating the design year traffic demands…*

2. *All reasonable alternatives to a new interchange have been considered including ramp metering, mass transit, and HOV facilities…*

3. *Proposal does not have a significant adverse impact on the operations and safety of the Interstate facility or on the local street network based on both the current and future traffic projections…*

4. *A full interchange with all traffic movements connecting to a public road is provided…*

5. *The proposal considers and is consistent with local and regional land use and transportation plans…*

6. *Consistency with long-range systems or network plans…*

7. *Coordinated with the area's development…*

8. *Request can be expected to be included as an alternative in the required environmental evaluation, review and processing.*

1.2 PURPOSE AND NEED

The purpose of the project is to evaluate capacity improvements to the existing interchanges located along I-275 from the Howard Frankland Bridge to the Hillsborough River, including an evaluation of interchange improvements not previously considered in the 2001 SIMR. Such improvements include the addition of express toll lanes along the interstate mainline within the SIMR area of influence and, specifically, for the interchange at I-275 and State Road (SR) 60 / Memorial Highway. This MLOU will summarize and document all methodology agreements reached between the FDOT's District Seven Interchange Review Team, FDOT Central Office and FHWA. The SIMR will document the existing conditions in the study area, the future year travel demand forecasts and the analysis of future conditions for express toll lanes, general use lanes, ramps and access/egress points between the interstate mainline and the express toll lanes system.

1.3 PROJECT LOCATION

The proposed improvements are located along I-275 within the City of Tampa in Hillsborough County, Florida between milepost 1.122 (Memorial Hwy/SR 60/Exit 39) on the west side and milepost 5.872 (Willow Avenue) on the east side as shown in **Figure 1**, project location. Similarly proposed interchange modifications are located along SR 60 between milepost 0.000 (Kennedy Blvd) on the south side and milepost 1.000 (Spruce Street) on the north.

1.4 AREA OF INFLUENCE (AOI)

The proposed area of influence along I-275 is from west of Memorial Hwy/SR 60 interchange (Howard Frankland Bridge) to Willow Avenue. The proposed area of influence along SR 60 is from south of I-275 to north of Spruce Street. Although I-275 is in general a north-south limited access facility, the alignment of this roadway within the area of influence is east-west. Throughout this MLOU, reference will be made to eastbound I-275 and westbound I-275, which corresponds to northbound and southbound orientations, respectively. **Figure 2** shows the proposed area of influence for the SIMR.

The SIMR project limits along I-275 extend from the eastern end of the Howard Frankland Bridge to Willow Avenue (just west of the Hillsborough River), a distance of approximately 4.75 miles. The seven existing interchanges and interchange ramps that are located within the I-275 area of influence are as follows:

- Kennedy Boulevard (S.R. 60) - Ramps to/from the west only;
- Memorial Highway - Ramps to/from the east and to/from the west;
- Westshore Boulevard
- Lois Avenue - Ramps to/from the east and to/from the west;
- Dale Mabry Highway - Ramps to/from the east and to/from the west;
- Himes Avenue - Ramps to/from the east only; and
- Howard/Armenia Avenue - Ramps to/from the east and to/from the west.

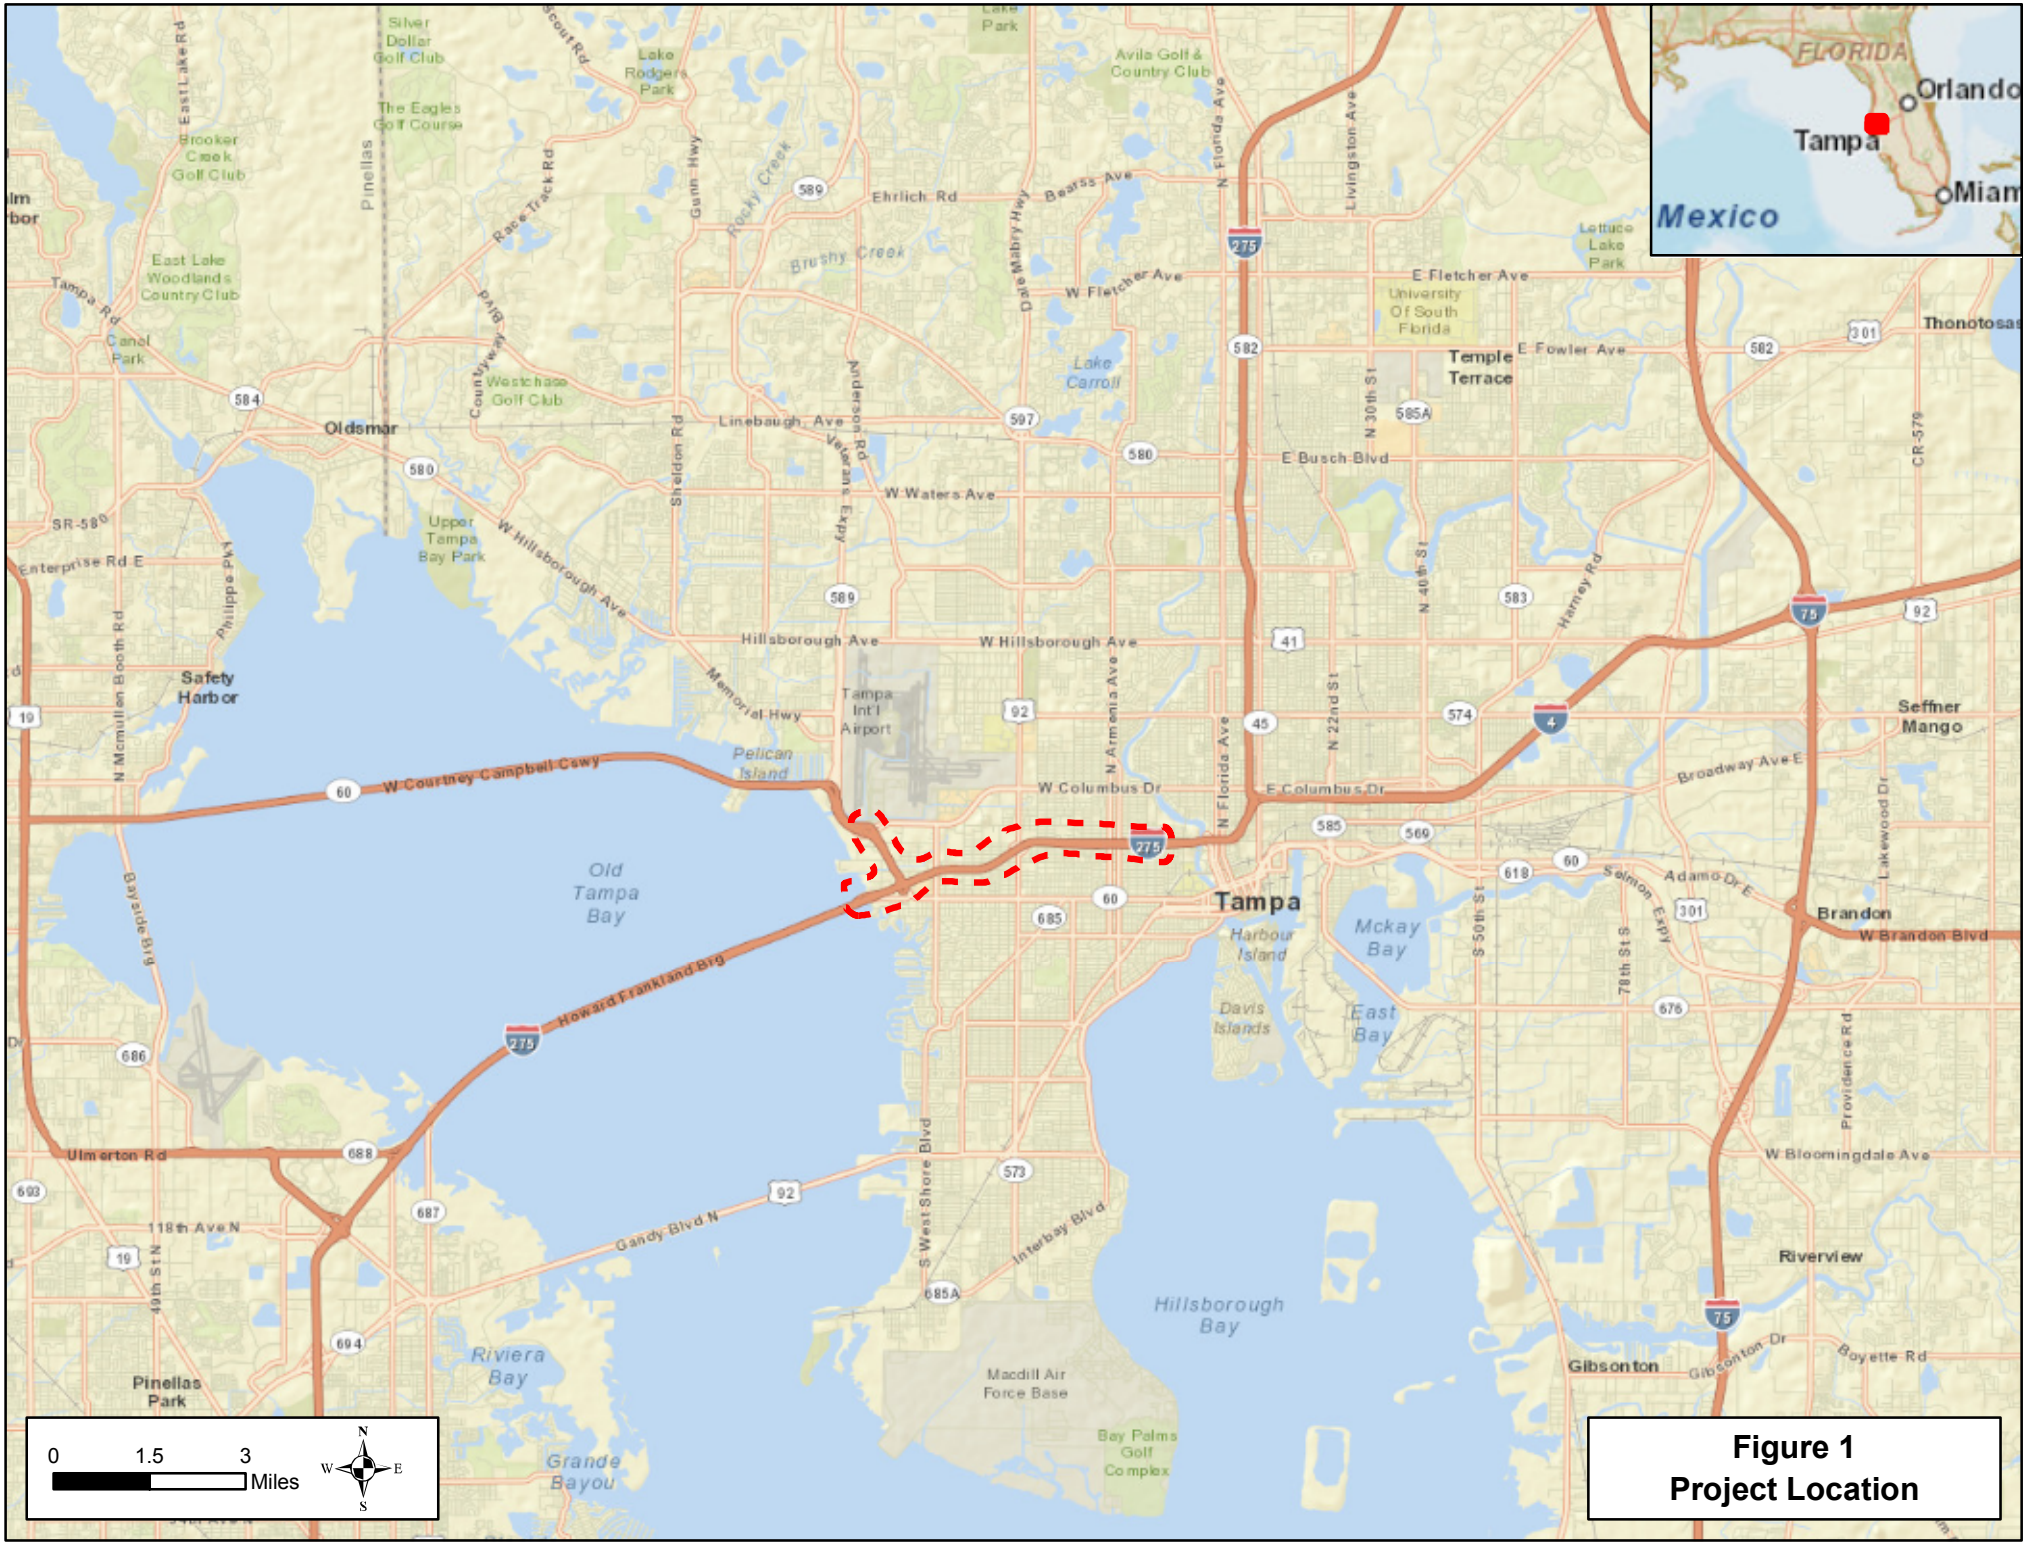

Figure 1
Project Location

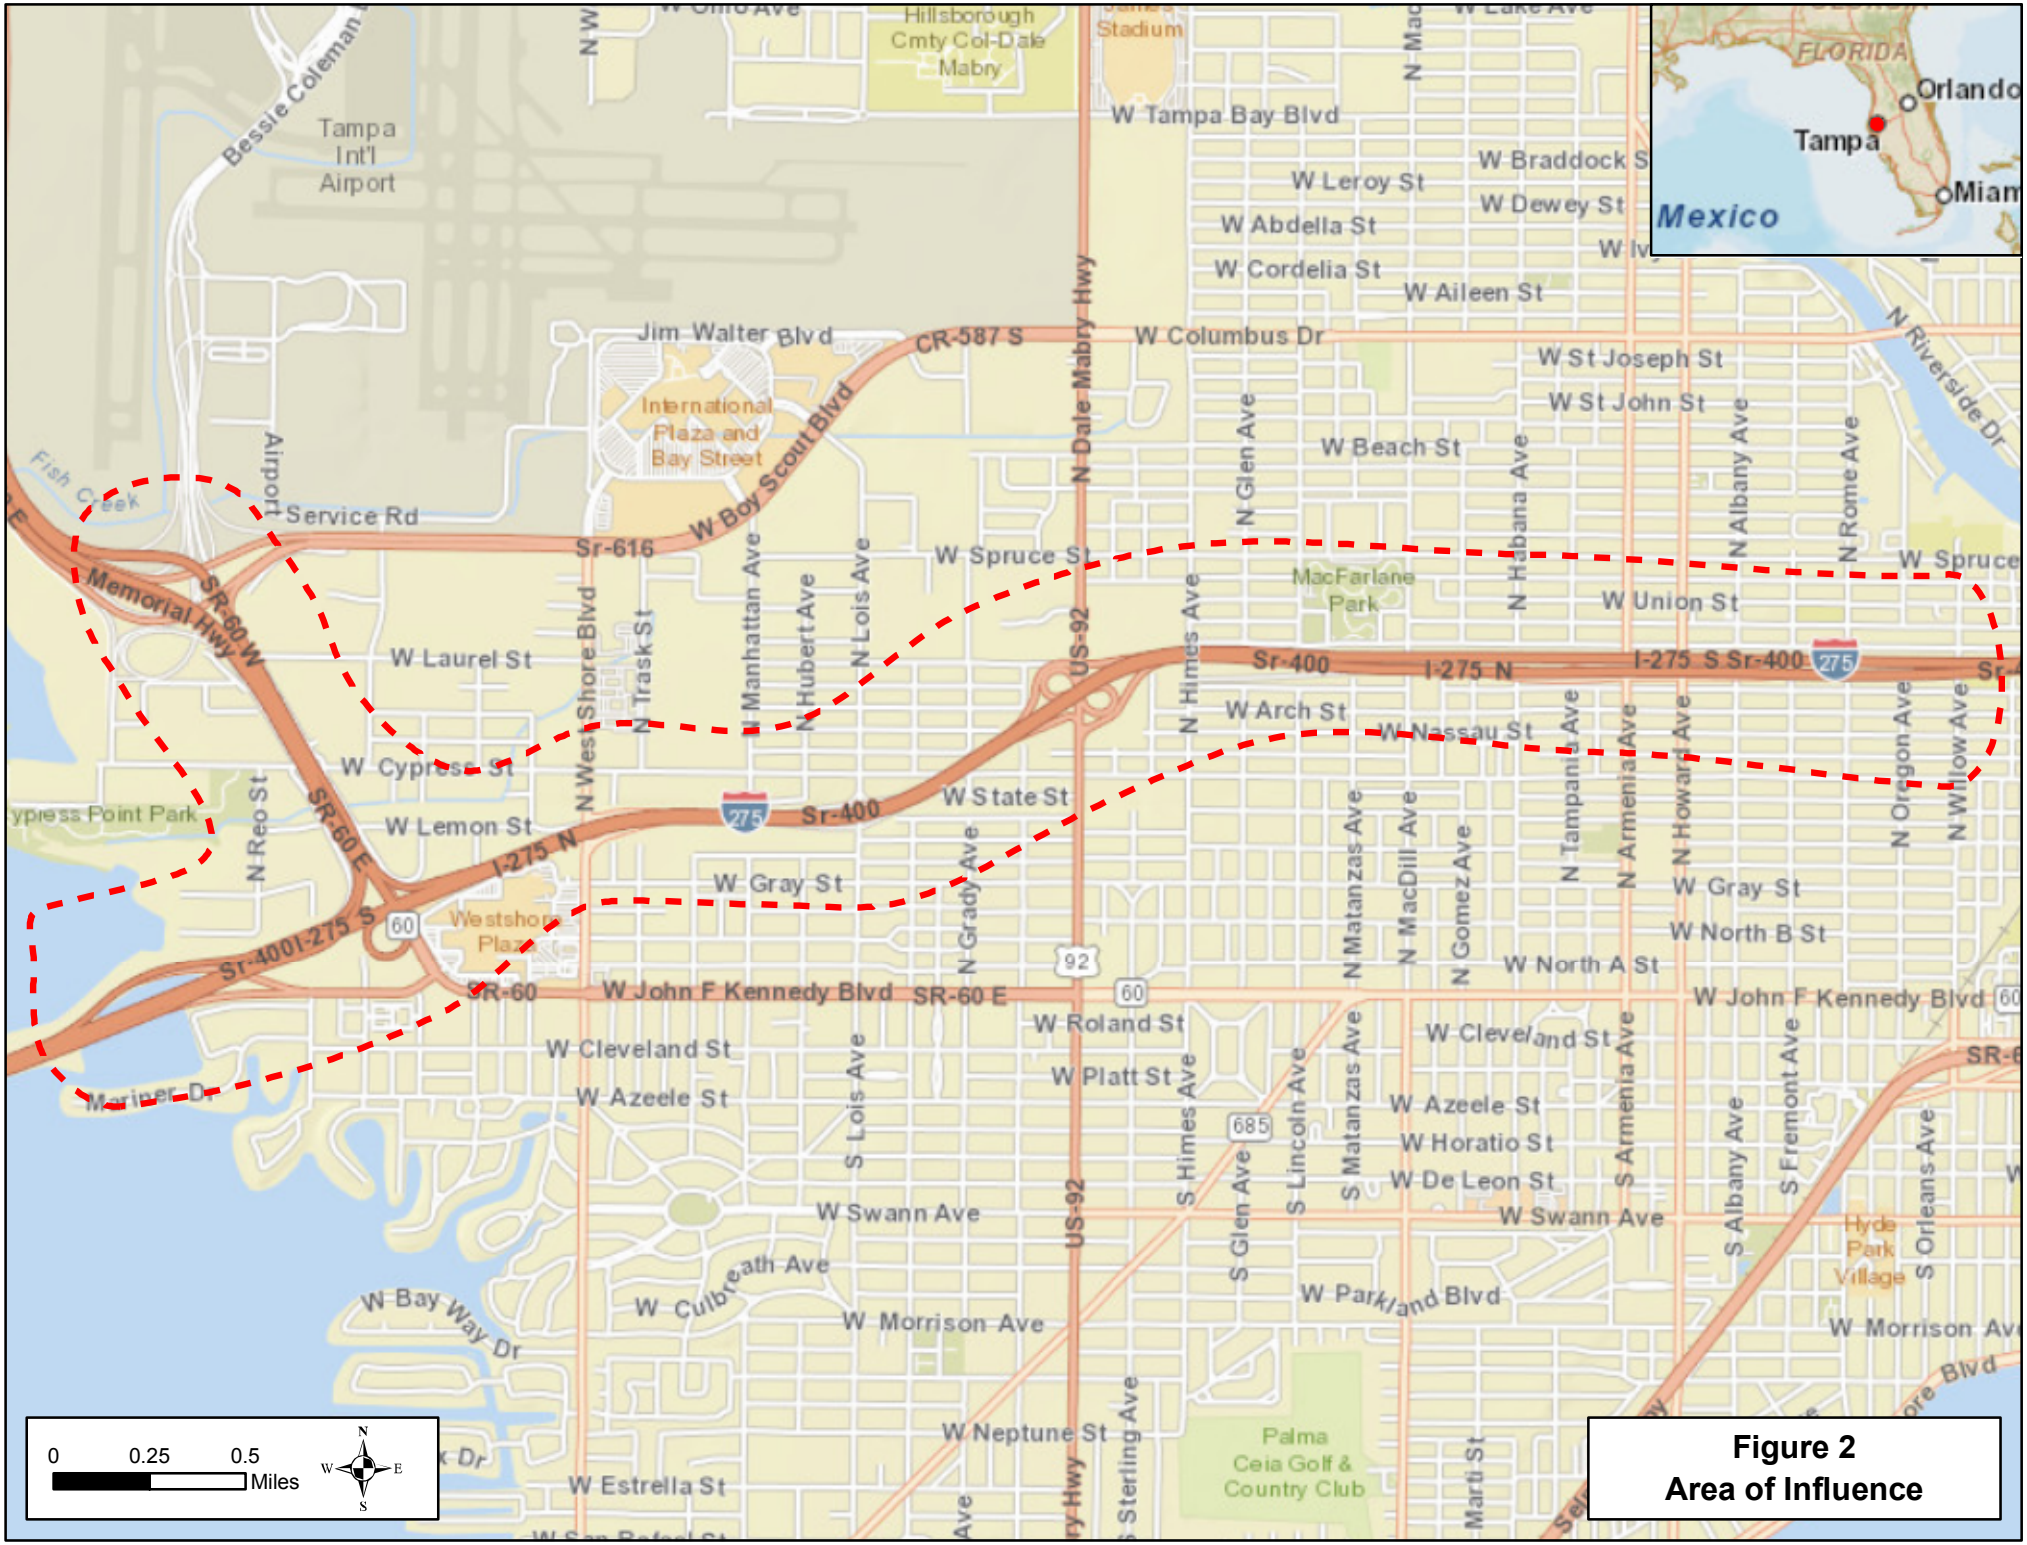

Figure 2
Area of Influence

1.5 PROJECT SCHEDULE

The proposed SIMR process is anticipated to be completed in approximately eighteen (18) months, from approval of the MLOU, as summarized in the tentative project schedule provided in **Appendix A.** A schedule of production activities (Design, ROW, and Construction) will be provided in the SIMR.

Section 2.0
ANALYSIS YEARS

2.1 FOR TRAFFIC FORECASTING

The years to be used for the travel demand forecasting:

- Base Year: 2006
- Horizon Year: 2035

The forecasting of traffic volumes is based on the Tampa Bay Regional Planning Model – Managed Lanes (TBRPM-ML) Version 24. Travel demand forecasting procedure is described in section 5 of this MLOU. Appendix C contains the TBX Master Plan traffic forecasts and the methodology used in the development of the traffic forecasts.

2.2 FOR TRAFFIC OPERATIONS ANALYSIS

The years to be used for the traffic operations analysis are as follows:

- Existing Year: 2014
- Opening Year: 2020
- Interim Year: 2030
- Design Year: 2040

Section 4, Data Collection describes the types of data to be collected and adjustments to traffic counts to be used in the SIMR. Details of types of Traffic Operational Analysis such as procedures, measures of effectiveness, software used are provided in Section 6.

The analysis years proposed for the SIMR are consistent with the PD&E study and the facility Master Plans.

Section 3.0
ALTERNATIVES

Activities anticipated for this section of the SIMR process will include the development and evaluation of alternatives for the interstate system and interchanges within the area of influence. It is anticipated that up to three alternatives will be analyzed, including the No-Build Alternative (without modification). The proposed Build Alternatives are described below and concept plans are provided in **Appendix B**.

- **No-Build Alternative** – Assumes current reconstruction of I-275 is complete by 2016

- Transportation Systems Management and Operations **(TSM&O)** Alternative – Evaluation of measures leading to improvement of traffic flows through non-capacity improvements including but not limited to Intelligent Traffic Systems deployment, intersection optimization and increased share of alternatives to single occupancy vehicles. It involves optimizing the use of existing facilities. TSM improvements would not adequately accommodate forecasted traffic volumes within the SIMR interchange area. Thus, the TSM Alternative is not considered a viable alternative for this SIMR.

- **Build Alternative** - Four general use lanes and two express toll lanes in each direction of travel; geometry for analysis years 2020 and 2030 will be based on Tampa Bay Express Starter Projects network (See Appendix B-1); geometry for analysis year 2040 will be based on Tampa Bay Express Master Plan network (See Appendix B-2).

  The improvement concept is being further refined at some locations in the AOI, especially at I-275 and SR 60 interchange with respect to ramp connections to Veterans Expressway and SR 60 from I-275 Managed Lanes. The latest version of the refined alternative is depicted in Appendix B-3.

Section 4.0
DATA COLLECTION

4.1 TRANSPORTATION SYSTEM DATA

Available existing traffic data for the I-275 freeway mainline and ramps will be obtained from FDOT District Seven. All other traffic data will be determined using the procedures described below.

4.2 EXISTING AND HISTORICAL TRAFFIC DATA

Existing daily vehicle counts and turning movement counts will be taken within the study area. Daily vehicle counts will be conducted on weekdays for up to seventy-two (72) hours; peak hour turning movement counts will be conducted from 7:00 to 9:00 a.m. and from 4:00 to 6:00 p.m. for the morning and evening peak hours, respectively. Existing traffic used in the project will be less than three years old; the turning movement counts (TMCs) and 72 hours classification counts will be collected according to guidelines in the Project Traffic Forecasting Handbook if applicable. Traffic counts should be adjusted with appropriate seasonal and axle correction factors if applicable. It is anticipated that traffic counts will be obtained from the Department or collected by URS at the following locations:

Interchanges/Intersections

- I-275/Memorial Highway Ramps
- Kennedy Boulevard and SR 60
- I-275/SR 60 Ramps
- I-275/Westshore Boulevard Ramps
- I-275/Lois Avenue Ramps
- I-275/Dale Mabry Highway Ramps
- I-275/Himes Avenue Ramps
- I-275/Armenia Avenue/Howard Avenue Ramps

Roadway Segments

- Independence Parkway
- Memorial Highway
- Westshore Boulevard
- Lois Avenue
- Dale Mabry Highway

- Himes Avenue
- Armenia Avenue
- Howard Avenue

Existing roadway characteristics including functional classification, lane geometry, pedestrian accommodations, bicycle facilities, traffic control devices, access locations and spacing, and posted speed limits will be obtained and documented in the SIMR. In addition, the data collection effort will include an evaluation of travel times and peak hour queues as necessary to calibrate the CORSIM model[1]. Travel time and delay runs will be conducted on the mainline of I-275 between 7:30 a.m. and 8:30 a.m. and between 5:00 p.m. and 6:00 p.m. for each day that traffic counts are performed. Given the ongoing construction activity on I-275 in the study area, any traffic counts collected at locations where detours or lane closures may affect the validity of the count will be noted and manual adjustments may be made by:

1. Comparing the count to any available count collected prior to the construction efforts.
2. Reasonableness check for traffic growth with a site outside the construction area.
3. Please note that additional adjustments may be made on a case by case basis. All the adjustments to traffic counts will be documented in the SIMR.

All data collected and traffic count adjustments will be summarized in an Existing Conditions Report and provided to FDOT and FHWA for review and comment.

4.3 LAND USE DATA

Existing and future land use data within the area of influence will be obtained from the adopted Comprehensive Plans of the City of Tampa and Hillsborough County; applicable information will be documented in the SIMR.

4.5 PLANNED AND PROGRAMMED PROJECTS

Planned and programmed transportation projects within the area of influence will be obtained from the latest adopted FDOT Five-Year Work Program, Strategic Intermodal System Plan(s), and State Transportation Improvement Plan; City of Tampa Capital Improvement Plan; and Hillsborough County Metropolitan Planning Organization (MPO) Long Range Transportation Plan (LRTP). Applicable information will be documented in the SIMR.

[1] Study area is under construction with varying geometrics and traffic patterns. Existing conditions calibration efforts and evaluation of existing conditions may not be reliable due to this situation.

Section 5.0
TRAVEL DEMAND FORECASTING

5.1 SELECTED TRAVEL DEMAND MODEL

The latest available version of the TBRPM-ML will be utilized to develop the future year daily traffic projections. The TBRPM-ML is based on the Florida Standard Urban Transportation Modeling Structure (FSUTMS) and is recognized by both FDOT District Seven, as well as the Tampa Bay Area MPOs, as an acceptable travel demand forecasting tool which has been used to develop Design Traffic for the ongoing Tampa Bay Express Master Plan. The ultimate roadway network to be used reflects the adopted Cost Affordable Long Range Transportation Plans for all counties within the district

5.2 PROJECT TRAFFIC FORECAST DEVELOPMENT

Forecasts of future traffic volumes will make maximum use of the version of TBRPM-ML and the Directional Design Hourly Volumes (DDHVs) obtained from the FDOT District Seven Tampa Bay Express Study. A technical memorandum with the procedure used to develop Annual Average Daily Traffic (AADT) volumes, including key post model adjustments, is included in **Appendix C.**

5.3 VALIDATION METHODOLOGY

The TBRPM-ML has been reviewed to ensure that it accurately reflects the characteristics of the study area and surrounding roadway network. The latest socioeconomic (SE) data approved and used for the Hillsborough County MPO LRTP was obtained from all Counties comprising FDOT District Seven and used in the development of the travel forecasts.

5.4 TRAFFIC ADJUSTMENT PROCEDURES

Any refinements to the TBRPM-ML and the DDHVs from the FDOT District Seven Express Lane studies due to changes in geometry or proposed design will be identified during the MLOU phase. Revisions will be made as necessary, and documented in the SIMR.

5.5 DEVELOPMENT OF DAILY AND DESIGN HOUR TRAFFIC

Daily and Design Hour Traffic was obtained from the TBRPM-ML Time of Day Model and in specific from the traffic development effort related to the Tampa Bay Express Master Plan.

The TBRPM ML provides year 2035 traffic projections, broken down into four times of day, namely:

- AM Period (2.5 hours),

- Mid-Day (6.5 hours),
- PM Period (3 hours) and
- Evening Period (12 hours).

The peak period volumes were converted to peak hour volumes by applying diurnal factors (AM 0.41; PM 0.35) corresponding to the percentage of traffic occurring during the peak hour for the AM and PM periods. An area Model Output Conversion Factor (MOCF) factor of 0.95 was used to convert daily model outputs to AADTs.

Design year volumes were compared to the year 2012 volumes. At some locations, the existing (2012) volumes were higher than the year 2035 model volumes. In order to maintain a reasonable growth pattern, manual adjustments were applied for freeway segments and ramps where design year volumes are lower than the existing conditions.

As a result of adjustments made to some of the freeway segments and ramps, the mainline volumes may deviate from the model outputs. To avoid significant deviation from the model outputs, a set of control locations were selected. Traffic volumes were adjusted to match the model outputs at the control locations to the maximum degree possible.

A complete set of reasonableness checks was conducted to ensure:

a. Volumes increased from 2012 through 2040
b. Directionality was reasonable and defensible
c. Peak to daily ratios were reasonable and defensible
d. Maximum loadings to managed lanes did not exceed the LOS D capacity of the facility

Documentation of the traffic development process and daily/peak hour future volumes are included in **Appendix C**. A TBRPM-ML model structure and list of improvements from TBRPM daily model to TBRPM time of day model is also included in Appendix C.

5.5.1 Truck Factors (T)

Truck Factors (T) to be used in the analysis will be derived by considering historical traffic data and existing measured traffic characteristics from traffic counts. Portable traffic monitoring sites [available from FDOT *Florida Traffic Information & Highway Data* (2012)] will be used to determine the historical daily truck factors (T_{24}). As outlined in the *FDOT Project Traffic Forecasting Handbook 2012* and based on the assumption that only half as many trucks travel on the roadway during the peak hour, the T-Factor(s) will be derived by dividing the daily truck factors by two. The results from both methods will be evaluated and a recommended T-Factor will be presented to FDOT District Seven for review and approval prior to initiation of the traffic analysis.

Section 6.0
TRAFFIC OPERATIONAL ANALYSIS

6.1 EXISTING AREA TYPE/TRAFFIC CONDITIONS

Traffic operations analyses for the a.m. and p.m. peak hours will be conducted to document the existing levels of service within the area of influence. The results of the existing conditions analysis will be summarized in graphical and/or tabular format and presented in the SIMR.

6.2 TRAFFIC ANALYSIS SOFTWARE

For existing conditions, a base year CORSIM (TSIS version 6.3) simulation model will be developed and the analysis will be performed based on the guidelines and recommendations contained in the FHWA *Traffic Analysis ToolBox Volume IV, Guidelines for Applying Traffic Microsimulation Software* (FHWA, 2007). In addition, an evaluation will be performed based on Highway Capacity Software (HCS 2010).

The analysis will include all ramp merge/diverge areas, signalized ramp terminal intersections, major intersections, and roadway segments within the area of influence. Queue lengths determined as a result of the analysis will also be calculated and compared to the existing field-measured queues.

Results of the CORSIM and HCS analysis will be summarized using measures of effectiveness such as density, travel speeds, v/c ratios and levels of service. Special emphasis will be made to ensure there will be adequate weaving distances in the express toll lanes access/egress points in order for traffic to enter/exit the express toll lanes via the general use lanes to the ramp terminals or vice versa. The split in traffic between the express toll and general use lanes will assume that the express toll lanes travel demand will be metered by variable tolls at such a level that their operation will be maintained at an acceptable level of service. The model volumes will be adjusted manually using CORSIM to achieve this goal.

6.3 CALIBRATION

Relevant field collected data; traffic volumes, peak hour speeds, and travel times will be used in the calibration efforts for the simulation model. The calibration methodology will be consistent with recent similar studies throughout the State dealing with express toll lanes and specific calibration criteria and targets discussed in this MLOU.

Traffic volume data, speed data and field observations (in combination with other available data sources such as RITIS data) will be used in the calibration of the CORSIM simulation model. Since no major land use changes are proposed within the area, the CORSIM model will only analyze the opening (2020) and design year (2040).

All ramp, mainline, and entry volumes will be calibrated to meet the criteria specified in the FHWA *Traffic Analysis Toolbox*. Individual link flows will be approximately 15% of field flows for more than 85% of cases. Travel times targets are anticipated to be within 15% of the field measured speeds for more than 85% of cases.

For critical locations with known bottlenecks attempt will be made to meet the calibration thresholds more aggressively (less than 15%). Queues will be verified based on documented queues observed in the field. A three hour AM and PM peak period analysis will be conducted using 15-minute flow rates. Visual Audits of the simulation will be performed to analyst's satisfaction to observe speed-flow relationships for individual links and acceptable queuing at bottlenecks. In addition to average travel speeds, individual link speeds and speed-flow diagrams will be used to evaluate the performance of the freeway segments.

For locations where unmet demand exists beyond the three hour period analyzed, the temporal limits will be expanded to a maximum of five hours using 15-minute volumes to attempt to dissipate the unmet demand. After the five-hour period, if unmet demand still remains in the model, then the processed described in the *Traffic Analysis Toolbox* will be used to quantify the unmet demand.

6.4 MEASURES OF EFFECTIVENESS

The acceptable LOS standard is "D" for the freeway, ramps and intersections within the area of influence.

Measures of Effectiveness used to evaluate and compare the Build and No-Build Alternatives will be as follows:

- Signalized intersections –Delay, LOS, v/c ratio (where applicable)
- Ramps Merge/Diverge – LOS, Density
- Freeway Segments – Density, LOS, Speed and Travel Time

The congestion and MOEs along the study corridor will be evaluated and described with the combination of Heat Diagrams, Lane Schematics in graphical format identifying congested locations and the speed ranges for those locations. Freeway segments where the simulated volumes falls below 85 percent of the actual demand volume will also be identified on the lane schematics. The combination of Heat Diagram and Lane Schematics will be used to identify congested locations, cause of congestion, duration and length of congestion. The SIMR will identify and address all impacts associated with the build alternative on the system.

Section 7.0
SAFETY ANALYSIS

Crash data will be obtained from FDOT District Seven records for the most recent five-year period on the mainline, interchanges, and major cross streets within the area of influence. The data collected shall include the number, type and location of crashes, number of fatalities and injuries, and estimates of property damage and economic loss.

Utilizing the information obtained from the crash data, the evaluation will identify needs associated with the safety of the existing facility. The SIMR will identify the source of the crash data, as well as provide tables and figures summarizing the analysis results. An objective and quantitative evaluation of the proposed improvements on traffic safety along the corridor will be performed by utilizing the FHWA Crash Modification Factor (CMF) clearinghouse and Crash Reduction Factors (CRF) associated with the counter measures where applicable. Engineering judgment and a data driven method will be used where CMFs and CRFs are not applicable.

The relationship of the proposed improvements to emergency service vehicles and hurricane response capacity will also be provided in the SIMR.

Section 8.0
PLAN CONSISTENCY

The latest adopted transportation plans available will be reviewed and a summary of the project's consistency status will be provided in the SIMR.

Section 9.0
ENVIRONMENTAL CONSIDERATIONS

An Environmental Reevaluation shall be conducted concurrent with the SIMR task. A summary of key environmental findings from the environmental reevaluation will be added to the SIMR when they become available to ensure there are no fatal flaws for the proposed improvements.

Section 10.0
COORDINATION

Relevant coordination with all agencies and stakeholders during the process will be documented in the SIMR.

Section 11.0
ANTICIPATED DESIGN EXCEPTIONS AND VARIATIONS

At the time of preparation of this MLOU, there are no known design exceptions or variations to any FDOT or FHWA policies, rules, or standards. If an exception or variation should arise, it will be processed per FHWA and FDOT standards.

Section 12.0
CONCEPTUAL SIGNING PLAN

A conceptual signing plan in accordance with FHWA guidelines will be prepared for the proposed alternatives under consideration. The purpose of the signing plan is to demonstrate the ability to provide adequate advance signing and directions to drivers entering and/or exiting the interchange under the proposed configuration. A disclaimer stating the signage is conceptual and subject to final design will be added to the SIMR signing plans, in specific the following note will be added:

"A conceptual signing plan graphic will be created for planning and discussion purposes only. This graphic is not intended for use in PD&E, Design, or Construction. When this project is programed for design; the signing, pavement markings and intelligent transportation system (ITS) improvements will be evaluated and designed as necessary for future construction"

Section 13.0
ACCESS MANAGEMENT PLAN

If determined necessary during the development of the SIMR, an access management plan will be developed within the area of influence to supplement improvements to the interchanges.

Section 14.0
FHWA POLICY POINTS

Compliance to the FHWA policy points will be discussed and documented to the maximum extent applicable.

Section 15.0
MLOU CONCURRENCE

The FHWA, FDOT Central Office Systems Planning Office, and FDOT's District Seven Interchange Review Team have reviewed the MLOU and concur that it is acceptable for use in the I-275 SIMR Update. FDOT District Seven acknowledges that this MLOU will not be binding upon the FHWA to approve the interchange proposal under any circumstances, nor will it nullify the FHWA's right to request changes to the study design or require additional data collection, analysis, or documentation at any point during the process. FDOT District Seven also acknowledges that full compliance with all of the MLOU requirements does not obligate the FHWA to approve the interchange proposal.

Tampa Bay Express Master Plan Traffic Forecasts

List of Improvements/Updates from TBRPM Daily Model to TBRPM TOD Model	
1	Define time periods: AM Peak: 6:30AM - 9:00AM Mid-day: 9:00 AM - 3:30PM PM Peak: 3:30 PM - 6:30 PM Evening: 6:30 PM - 6:30 AM
2	Generate Time-of-day factors from the 2000/2007 household survey: a) Peak splitting factors by trip purpose b) AM/PM or MD/EV splitting factors by purpose (HBW, HBNW and NHB) c) PA splitting factors by purpose (HBW, HBNW)
3	For 0 car households: a) Separate 0 car trip generation b) Trip distribution based on highway skims c) Mode choice input tables were divided into 0 car, 1 car, and 2+ car households
4	TAZ Splits in Westshore, USF and Bruce B Down; also in Pinellas and Pasco Counties; Applied Pasco County land use alternative.
5	Trip Distribution: a) Friction Factor calibration for peak and off peak periods b) AM peak trip distribution is based on congested skims from the pre-distribution and pre-assignment; Off peak trip distribution is based on free flow skims c) Feedback loops were applied to ensure the input speeds are consistent with output speeds
6	Employee survey results for major activity centers were applied to HBW person trip tables after Peak and Off peak distribution. The HBW trips were updated in zipcode level based on employee survey or CTPP for the following locations: a) Tampa CBD b) TIA c) University Community Hospital d) Busch Gardens e) Veterans Hospital f) Moffit Center g) USF h) MacDill Air Force Base i) Westshore Other trips were also updated: j) Airport Passenger Trips k) USF Student Trips
7	Transit network coding convention was re-defined and transit path building was calibrated based on FTA's requirement. Transit path was also modified based on mode choice requirement.
8	Mode Choice program was re-written and nested logit structure was modified to meet FTA's requirement; includes four time periods. Choice set concept was introduced from the Charlotte experience.
9	Four highway assignment modules were implemented in the HASSIGN step (4 periods). 24 hour assignment module is also available by combining the trips tables before the final assignment.
10	Examined capacity and speed inputs within the study area.
11	Update the EI and IE trips by TOD on Interstate facility external Stations

Development of Average Annual Daily Traffic (AADT) &
Directional Design Hourly Traffic Volumes (DDHVs) for the
Tampa Bay Express (TBX)
July 15, 2014

- **Background**

Over the past twelve months, FDOT District 7 Systems Planning Department has developed traffic forecasts for the Tampa Bay Express (TBX) system. The TBX plans include express lanes that are implementable and/or funded within the next five years (i.e. the Starter projects) and those ultimate express lane projects (i.e. the Master Plan project) for which funding or implementation will take place beyond a five-year horizon.

- **TBX Alternatives**

The three Tampa Bay Express (TBX) express lane alternatives are described below:

No-Build

The No-Build for the future design year consists of the existing geometry, on-going construction, and committed improvements. No express lanes are present in the No-Build network.

Starter Projects (Interim Improvement Projects)

The Starter Projects are projects that can be implemented in the next five years in coordination with the Florida Turnpike Enterprise (FTE) and with consideration given to those projects that are within the previously approved TIS Study limits of I-275 and I-4. Preliminary level Traffic & Revenue (T&R) analysis has been conducted by the FTE for each Starter Project.

PROPOSED EXPRESS LANES – STARTER PROJECTS

Interstate	From	To	Number of Express Lanes per Direction
I-275	118th Ave.	SR 60 (Memorial Hwy)	1
	SR 60 (Memorial Hwy)	East of Howard Ave.	2
	East of Howard Ave.	Willow Ave. with CD to North Blvd.	1
	North of Jefferson St/Orange Ave	North of Bearss Ave.	1
I-4	Crosstown Connector	East of Mango Rd.	1
I-75	North of SR 60 (Adamo Dr)	North of CR 581	1

Master Plan (Ultimate Managed Express Lane Improvements)

The Master Plan consists of managed express lanes for the ultimate managed express lanes projects. The Florida Turnpike Enterprise completed a preliminary T&R analysis for the Master Plan projects and is in the process of completing an update of the study. The system includes a new ramp (Willow Avenue/North Blvd) along I-275 just west of the I4/I275 Tampa Downtown

interchange) and ramp removals (Floribraska Ave. & Kay St in the vicinity of the I4/I275 Tampa Downtown interchange) as well as direct express-to-express lanes at the I-4/I-275 junction and the I-4/I-75 junctions.

PROPOSED EXPRESS LANES - MASTER PLAN PROJECTS

Interstate	From	To	Number of Express Lanes per direction
I-275	South of Gandy Blvd.	118th Ave.	1
	118th Ave.	Kennedy Blvd.	2
	Kennedy Blvd.	SR 60 (Memorial Hwy)	1
	SR 60 (Memorial Hwy)	Howard Ave.	2
	Howard Ave.	I-4/I-275 Junction.	3
	I-4/I-275 Junction	North of Bearss Ave.	2
I-4	I-4/I-275 Junction	Crosstown Connector	3
	Crosstown Connector	Polk Pkwy.	2
I-75	South of SR 674	North of CR 581	1

- **Existing Traffic Volumes**

The Annual Average Daily Traffic (AADT) and AM/PM peak hour volumes were obtained from the *FDOT Traffic Information DVD* counts and supplied by District Seven, adjacent Counties, and URS counts. Multi-day counts were averaged seasonally adjusted to represent typical weekday traffic conditions and balanced throughout the TBX Study area. Side streets connecting with the interstate ramps are based upon traffic counts balanced to the ramp volumes.

- **Future Traffic Volumes**

Traffic volumes for the Build alternatives were developed for opening, intermediate and design years of 2020, 2030, and 2040, respectively. The No-Build alternative volumes were developed for year 2040 conditions.

Key steps in developing the design years 2020, 2030, and 2040 volumes are described as follows:

o The Tampa Bay Regional Planning Model (TBRPM-ML) Base Year model was calibrated and validated against the 2006 traffic counts by Time of Day, to ensure the Base Year model outputted volumes correctly represent the existing traffic, especially along the I-275, I-4 and I-75 corridors.

o The TBRPM-ML Time of Day Model for the No-Build Project, Starter Project, and Master Plan Project were used to obtain year 2035 volumes. Annual Average Daily Traffic (AADT) and AM/PM peak period volumes were obtained from the TBRPM-ML time of day model to develop future volumes. The TBRPM-ML peak period volumes were converted to peak hour volumes by applying diurnal factors (AM 0.41; PM 0.35). These diurnal factors are based upon the hourly traffic distribution occurring along I-4, I-75, and I-275 located within the TBX area.

- Future traffic for 2020, 2030 and 2040 was developed around five key subareas corresponding with the individual managed express lane project areas, as follows: I-275 Pinellas County, I-275 TIS study area, I-275 North of Martin Luther King Jr. Blvd, I-4, and I-75. The annual growth rates were calculated by comparing existing AADTs from the *FDOT Traffic DVD* and the year 2035 AADTs from the TBRPM-ML travel demand model.

- A complete reasonableness check was conducted to ensure that the future projected traffic volumes reasonable progression between each of the five PD&E project limits and at the beginning/end of the managed express lanes.
- A full set of AADT and DDHVs traffic volumes was completed in late June 2014 and it includes AADTS and DDHVs for the entire TBX system, which includes a total of seventy (70) interchanges
- Upcoming tasks include the evaluation of future traffic conditions under individual PD&E traffic studies encompassing the TBX system and the SIMR study for I-275 between the Howard Frankland Bridge and the Hillsborough River.

MLOU Review Comments and Responses
MLOU Review Meeting Minutes

Submittals Reviewed	I-75 from HFB to Hillsborough River SIMR	FAP#	-
Reviewer	Phillip Bello & Kris Milster	FPID	258355-1-32-05
Date Document Received	8/14/2014	Contract #	-
Date Comments Submitted	8/21/2014		

No.	Location	Type (Crt., Enh. Edt. Cla.)	Comment	FDOT Response	FHWA Concurrence?
1	pg. 1-4	CRT	Based on App. B, there seems to be partial interchanges proposed. As a reminder, we would recommend spending a good deal of time justifying why partials (to/from Express Lanes and to/from GP Lanes) are needed. It is recommended that if the interim condition is the justification, a solid timeframe needs to be shown in the report.	Comment noted. Justification for partial interchanges will be provided in SIMR.	
2	pg. 1-5 / Sec. 1.2	CLA	First sentence: is this an operational improvement or capacity improvement?	Most of the modifications can be characterized as capacity improvement	
3	pg. 3-1	CLA	Will I-275/I-4 modifications be analyzed in this report?	No. The I-275/I-4 interchange improvements are outside the area of influence (AOI) for this SIMR.	
4	pg. 3-1	ENH	Please briefly summarize the adjustments to accommodate the fact that the traffic data is affected by the construction.	The adjustments are described in section 4.2 of the MLOU. The traffic count review and adjustment will include 1. Comparison to a traffic count at the same location dated prior to construction 2. Reasonableness check for traffic growth with a site outside the construction area. Please note that additional adjustments may be made on a case by case basis. All the adjustments to traffic counts will be documented in the SIMR.	
5	pg. 5-1 / Sec. 5.5	CRT	Please insert a TBRPM-ML structure diagram.	A TBRPM-ML structure diagram will be provided in the MLOU.	
6	pg. 6-2 / Sec. 6.2	EDT	Please insert the version of CORSIM and HCS. Please remove reference to DTA.	Versions of HCS and CORSIM will be specified and reference to DTA will be removed.	
7	pg. 6-2 / Sec. 6.3	EDT	Please remove the GEH statistic.	Reference to GEH statistic will be removed.	
8	pg. 7-1	CLA	Are there CMFs/CRFs for these types of analyses? Wherever these do not apply, we would recommend using engineering judgment and a data-driven safety method to address the safety components (e.g., weaving).	CMFs/CRFs will be used where applicable. For other improvements engineering judgment and data driven method will be considered as recommended.	
9	pg. 15-1	EDT	Please put Associate Division Administrator, instead of Program Operations Engineer.	Will do.	
10	page 1-1/1st paragraph	EDT	include the date FEIS' approval	FEIS approval date will be added.	
11	Page 1-1, last sentence	CLA	is this an operation or capacity improvement (see page 1-2 & 1-5)	Most of the modifications can be characterized as capacity improvement	
12	Page 1-3, 3rd paragraph	EDT	spell out TIS or is it define elsewhere in the document	TIS (Tampa Interstate Study) is spelled out in section 1.1, first paragraph (page 1-1).	
13	Page 1-2, 1st sentence	CLA	is the I-275/SR 60 SIMR part of the ROD?	The geometry contained in the 2001 SIMR was part of the TIS set of plans approved in 1997; however, the SIMR per se was completed in 2001 so the ROD precedes it.	
14	Page 1-3, second to the last bulletin, under 2012-2014	CRTS	There is safety concern pertaining to the separation of traffic utilizing delineator and stripping in lieu of barriers on a highway facility. Has this separation been identified and decision been documented?	The type of traffic separators has not been decided yet. It will be determined based FDOT Central Office guidance and coordination with FDOT District Seven.	

15	Page 1-6, section 1.5	ENH	in the submittal, please include schedule of production activities (Design, ROW, and Construction) consistent with the proposed funding and opening year.	Comment noted. A schedule of production activities (Design, ROW, and Construction) will be provided in the SIMR.	
16	Page 1-5, section 1.3	GNH	please provide both graph and written description, including mile post if applicable.	Milepost information will be added in Project Description and AOI sections.	
17	Page 1-5, Area of influence	ENH	please include graphs, showing locations.	A map showing the AOI will be included.	
18	Page 2-1, section 2.1	CRT	Existing traffic used in the project should be less than three years old; the turning movement counts (TMS's) and 72 hours classification counts should be collected according to guidelines in the Project Traffic Forecasting Handbook if applicable. • Traffic counts should be adjusted with appropriate seasonal and axle correction factors if applicable. • Travel Demand Forecast – include details of travel demand forecasting methodology (model to be used, validation/calibration efforts, historical trends analysis, growth rate development, development of future year project traffic, etc.) Appropriate data to compare with older and newer data.	Comment noted. This information regarding traffic counts and travel demand forecasting is provided in sections 4 and 5. Appendix C to the MLOU contains the TBX master plan traffic forecasts.	
19	Page 2-1, section 2.2 – Operation Analysis		in addition to your brief, consider analysis years of PD&E study, facility Master Plans and other plans. • Include details of operational analysis methodology (type of analysis, main line capacity analysis, ramp analysis, queuing analysis, weave analysis, signalized intersection analysis, arterial analysis, crash analysis, etc.)	The analysis years provided in section 2.2 are consistent with the PD&E study and the facility Master Plans. Details of the operational analysis are provided in section 6.	
20	Page 3-1, section 3.1	CRT	Please include the TMS alternative(s) if any, and if any alternative has been eliminated due to site conditions include a brief justification. • In addition, Queuing analysis should be done using traffic tools/software to show back up on mainline particularly if the intersection has failing level of service.	A TSM&O alternative is not being considered under this SIMR. The Queuing analysis is described in section 6.2.	
21	Page 7-1, section 7.0		Potential safety benefits should be discussed if the proposed improvements will contribute to a reduced number or severity of accidents. Also, discuss project's relationship regarding emergency service vehicles and hurricane response capacity if appropriate.	A brief discussion of safety benefits and relationship to emergency services will be provided in the SIMR.	
22	Page 9-1, section 9.0		A potential environmental impact summary considering all NEPA elements from fatal flaw perspective for each alternative should be considered.	Agreed. A summary of key environmental findings from the environmental reevaluation will be added to the SIMR when they become available to ensure there are no fatal flaws. Section 9-1 will be modified accordingly.	

I-275 SIMR MLOU MEETING MINUTES
AUGUST 13, 2014, 1:30PM
FDOT D7 Executive Conference Room

Attendee List:

David Winkle, FDOT
Richard Griffin, FDOT
Brian Shroyer, FDOT
Kevin Dunn, FDOT
Megan Arasteh, FDOT
Amy Neidringhaus, FDOT
Mary Sheets, FDOT
Martha Hodgson, FDOT
Naomie Alexis, FDOT
Menna Yassin, FDOT
Jeff Novotny, FDOT/American
Elaine Martino, FDOT/Martino Planning
Kris Milster, FHWA
Phillip Bello, FHWA
Domingo Noriega, URS
Ron Gregory, URS
Sri Meka, URS
Kevin Gu, URS
Matt Wey, HDR

Notes:

1. Waddah Farah (FDOT) provided an introduction and an overview of the proposed project. He stated that the project is funded for 2019 and the SIMR update needs to be completed as fast as possible.

2. Domingo Noriega (URS) explained that traffic counts conducted in the study area will be compared with counts from pre-construction dates and manual adjustments will be made as needed for those locations where traffic now is not representative of normal conditions. He also explained that the Opening and Interim year analysis will use the Tampa Bay Express Starter projects, and the design year will use the Master Plan projects. Domingo then provided an overview of schedule and of the proposed alternatives.

3. Amy Neidringhaus (FDOT): A review meeting will be held to review the latest concept plans prepared by HW Lochner for the SR 60/I275 interchange. After this review meeting, decision will be made on geometric revisions to the alternatives contained in the MLOU.

4. Phillip Bello (FHWA) asked to study the impact of express lanes traffic in the area around Willow Avenue. The MLOU will be revised to specifically address this concern.

5. Kris Milster (FHWA) requested the model structure that shows pricing application to determine the mode choice/ split. Elaine Martino will follow up and provide requested references for inclusion in the SIMR .

6. Srinivas Meka(URS) described the CORSIM existing conditions calibration methodology. This will be done according to the FHWA Traffic Analysis Toolbox guidelines. However the model will be calibrated to preconstruction conditions to represent normal traffic operations.

7. Kris Milster requested that the analysis shows representative peak periods, not just average day.

8. Waddah discussed how the connection to local streets (ramp terminals) make the network fail even if the v/c ratio is adequate on freeway and ramps.

9. Phillip Bello asked Amy to coordinate with Waddah's team to make sure the SIMR update results are consistent with reevaluations (note, meeting is planned for August 19)

10. Kevin Dunn (Traffic Ops) expressed concern about adequate signing for destinations such as downtown, TIA. He indicated Willow exit ought to be signed as Willow/N Boulevard and not as downtown. Coordination with the City may be needed regarding the branding of the West Bank as "Downtown". Kevin will provide URS a copy of the conceptual signing plan developed by HW Lochner for the I275/SR 60 interchange.

11. A discussion on the conceptual signing plan focused on the need to ensure that the proposed project can be properly signed. A disclaimer will be added to the plans stating that the final signage will be part of the design efforts.

12. FHWA wants continued coordination with City of Tampa, Hillsborough county and elected officials to keep them engaged.

13. Kris Milster requested that the reference to GEH statistic and dynamic traffic assignment be removed from the MLOU.

14. Jeff Novotny and Matt Wey commented that the same methodology statement template be used for rest of the managed lanes projects in Tampa Bay that are being conducted simultaneously with this project.

15. Phil Bello (FHWA) requested to specify the CORSIM and HCS versions to be used for this study in the MLOU

16. Waddah requested review comments on the MLOU no later than August 29th, 2014

Meeting adjourned at 3:30PM

1.0 Introduction

The Florida Department of Transportation (FDOT) has proposed an express lanes project for the three interstates (I-4, I-75, and I-275) within the Tampa Bay Area as a strategy for reducing congestion on these facilities. TSIS-CORSIM[1], better-known as CORSIM, is a stochastic simulation software program that was originally developed by the Federal Highway Administration (FHWA) and is now maintained by McTrans at the University of Florida. CORSIM has been accepted by the FDOT as a reliable, user-friendly traffic simulation tool and is widely used throughout the industry. Therefore, CORSIM version 6.3 was chosen as the tool to be used in analyzing the Tampa Bay Express Lanes (TBX) Projects.

This memorandum documents the field observations and CORSIM calibration process employed to replicate existing year (2012) AM and PM peak-period conditions for the I-275 express lanes from south of Gandy Boulevard to north of 4th Street North. CORSIM models were developed to analyze the operational benefits of the improvements on I-275 for the design year (2040) No Build and Master Project, the opening year (2020) Starter Project, and the interim year (2030) Starter Project scenarios for both the AM and PM peak periods, in addition to the existing year (2012) No Build scenario, using the same parameters that were used to calibrate the existing year (2012) CORSIM models.

2.0 Field Observations and Data Collection

Travel times were measured on April 8-10, 2014 during the AM and PM peak periods (7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM, respectively) using Holux m-241 GPS data loggers on the following four segments:

- Northbound I-275 from the Gandy Boulevard on ramp to the Roosevelt Boulevard/118th Avenue North off ramp
- Northbound I-275 from the Roosevelt Boulevard/118th Avenue North on ramp to the 4th Street North on ramp
- Southbound I-275 from south of the 4th Street North off ramp to south of the Roosevelt Boulevard/118th Avenue North off ramp
- Southbound I-275 from the Roosevelt Boulevard on ramp to the Gandy Boulevard off ramp

Signal timing plans were obtained from the City of St. Petersburg for the signalized intersection at the northbound I-275 off ramp to Gandy Boulevard for use in developing the CORSIM models. Traffic volumes were provided by FDOT for the northbound and southbound I-275 mainline and ramps within the study area. Turning movement counts were collected at the I-275/Roosevelt Boulevard ramp terminals on April 29, 2014. The I-275/Gandy Boulevard ramp terminal synopsis counts were obtained from the 2013 Florida Traffic Information[2] (FTI) CD and used in the development of the CORSIM models. Queuing data was collected on May 9, 2014 at the southbound I-275/Roosevelt Boulevard off ramp. All field data can be found in **Attachment A**.

3.0 CORSIM Model Development Methodology

CORSIM[1] version 6.3 was used to complete the traffic simulation analyses for this project. Procedures documented in the FHWA Traffic Analysis Toolbox Volumes III and IV[3] were used to perform the CORSIM calibration and analysis.

3.1 Network Development

The CORSIM modeling limits include the I-275 freeway from south of Gandy Boulevard to north of 4th Street North. The modeling limits also include ramp terminal intersections of the crossing arterials, Gandy Boulevard and Roosevelt Boulevard, to adequately model traffic platooning onto I-275. The following cross streets were included in the CORSM model network:

- Gandy Boulevard
- 118th Avenue North
- Roosevelt Boulevard
- Ulmerton Road
- Dr. Martin Luther King Jr Street
- 4th Street North

The modeling limits are shown graphically on **Figure 3.1**. The CORSIM link-node diagram for the existing configuration is shown in **Attachment B**. The plan sheets for each Alternative can be found in the appendices of the I-275 PD&E Design Traffic Technical Memorandum[4] (DTTM), dated June, 2015, as well as the link-node diagrams for the Starter Project and Master Project CORSIM Models.

3.2 Model Inputs

The percentage of trucks entering the system at all entry nodes (i.e. 8000 nodes) was specified as 3 percent in both the AM and PM peak periods for all twelve fifteen-minute time periods. The truck percentage was developed using the methodology in the FDOT Project Traffic Forecasting Handbook[5] and truck data obtained from the 2013 FTI[2] CD. The Free-Flow Speeds (FFSs) for each link in the model varied based on the posted speed limit of the segment. Five miles per hour (mph) was added to the posted speed limit to determine the FFS. FFSs were input as 35 mph for loop ramps and 50 mph for conventional diamond ramps. Signal timing plans were obtained from the City of St. Petersburg for the signalized intersection at the northbound I-275 off ramp to Gandy Boulevard and the pertinent information was input into the CORSIM model. All other intersections were either stop-controlled or free-flowing.

3.3 Volume Development

Existing conditions CORSIM analysis was completed using existing year (2012) volumes on the existing (no-build) network. Freeway and ramp traffic volumes were provided by the FDOT and were developed from the 2013 FTI[2] CD for the AM and PM peak periods. These volumes were developed as part of the larger TBX Projects that include various segments of I-275, I-4, and I-75 in the Tampa Bay Region.

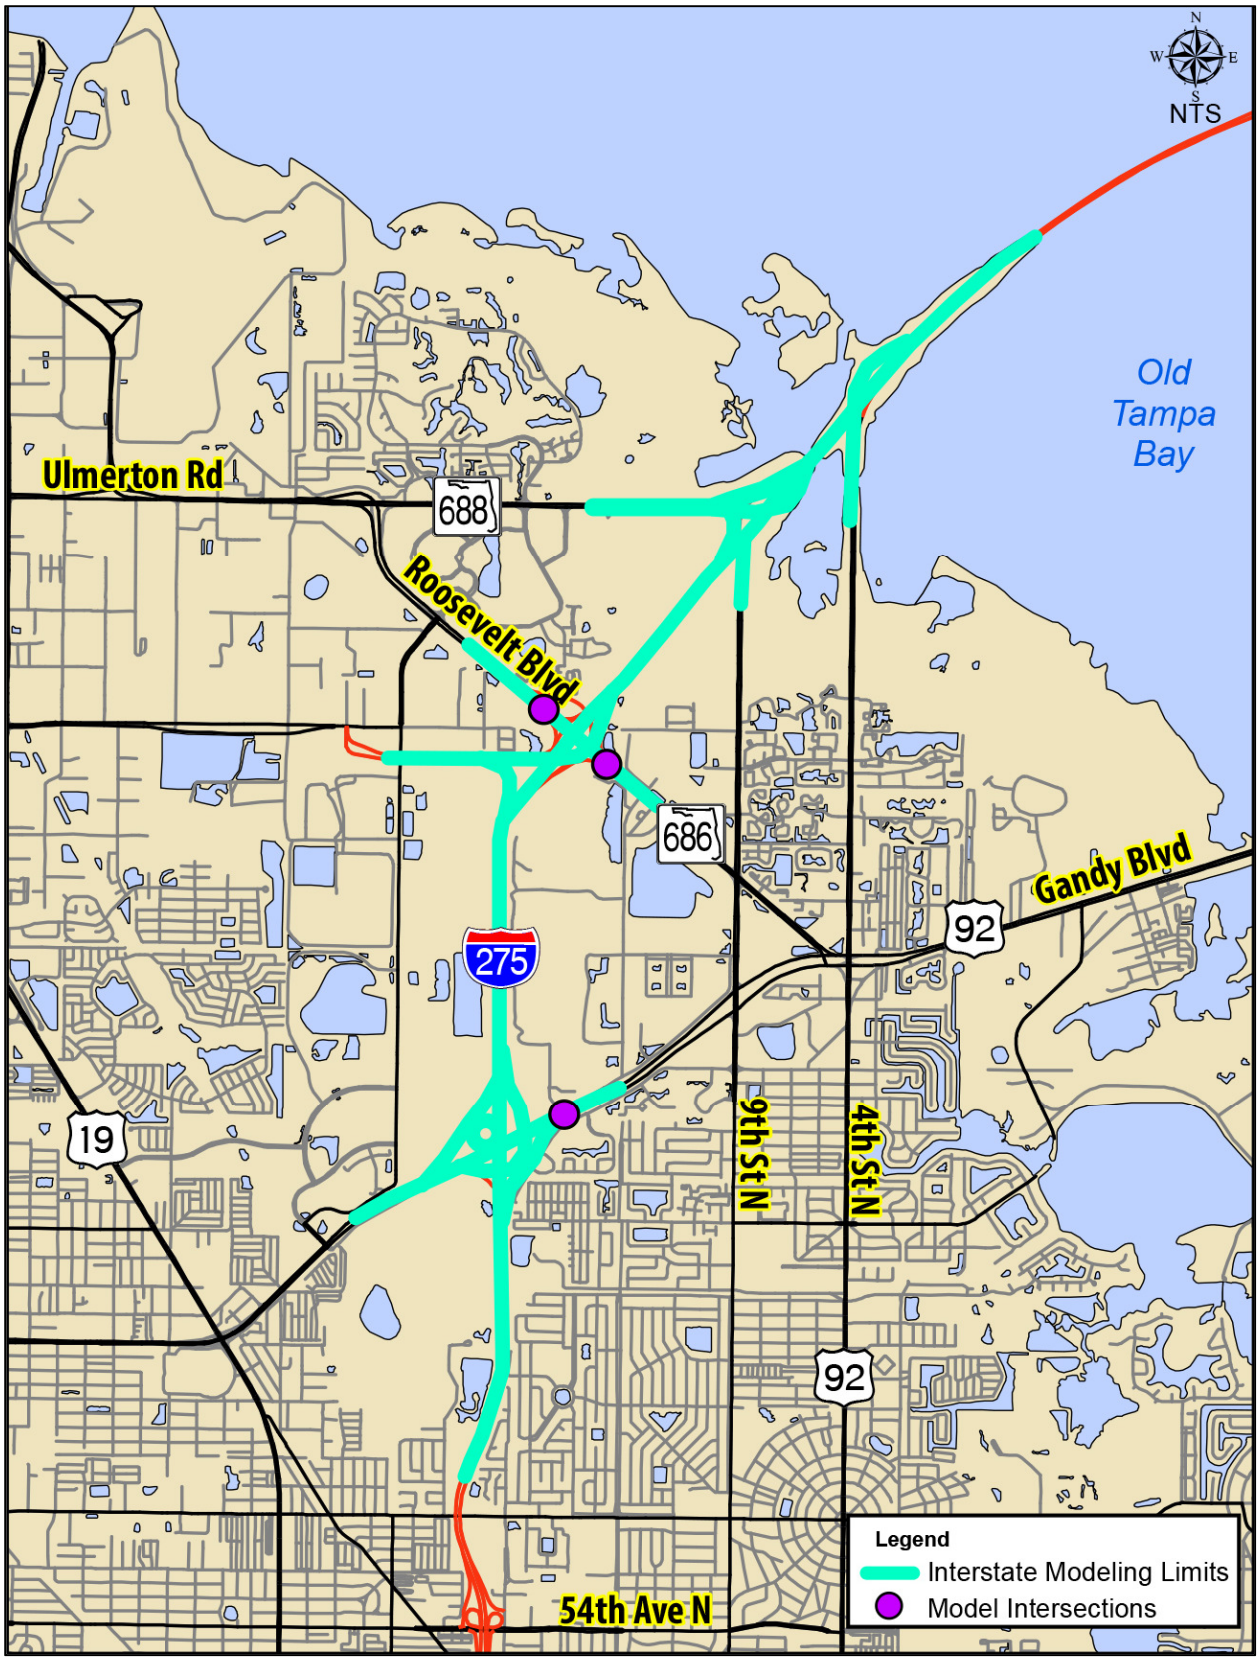

Figure 3.1. Modeling Limits

Turning movement counts were collected at all ramp terminals from 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM on April 9 and 10, 2014, except for Gandy Boulevard, which were obtained from the 2013 FTI[2] CD, and 22nd Avenue North, which were obtained from a recent study. The turning movement counts were smoothed proportionately to balance with the ramp volumes, which were held as the control volumes at the ramp terminals. The ramp terminals allowed platooning of vehicles onto the freeway to be replicated in the model. The Origin-Destination (OD) patterns in the CORSIM models were determined proportionately by the volume splits on a node-to-node basis. Conditional turning movements were coded as necessary to prevent vehicles from performing counterintuitive movements, such as using an off ramp and then using an on ramp going in the return direction.

3.4 Temporal Limits

A three-hour multiple-period analysis was performed to capture the effects of congestion building before the peak hour and remaining after the peak hour. Each run was divided into twelve fifteen-minute time periods. The hour preceding the peak hour was comprised of time periods one through four, the peak hour was comprised of time periods five through eight, and the hour succeeding the peak hour was comprised of time periods nine through twelve. The AM and PM global peak hours were determined to occur from 7:00 AM to 8:00 AM and from 4:45 PM to 5:45 PM, respectively.

The volumes of the hours adjacent to the peak hour were determined by applying a factor to the peak-hour volumes in order to proportionately scale the balanced peak-hour volumes. FTI[2] synopsis data was used to determine global scale factors for both the AM and PM peak periods. The scale factors were determined by the ratio of adjacent peak-hour volumes to actual peak-hour volumes and weighting those ratios by the peak-hour volumes in order to obtain one overall global ratio. Scale factors of 0.76 and 0.89 were used for the adjacent hour before the peak hour for the AM and PM peak period, respectively, and scale factors of 0.83 and 0.82 were used for the adjacent hour after the peak hour for the AM and PM peak period, respectively. All three analysis hours were adjusted by the peak-hour factor of 0.95 to account for the variability in flow rate within the four fifteen-minute periods of each of the three hours. Note that the peak-hour results were used for the CORSIM model calibration. The three-hour analysis period results were used to produce heat diagrams, as shown in the appendices of the I-275 PD&E DTTM[4], dated June, 2015.

3.5 Model Error Checking

Ten different model runs were performed for both the AM and PM peak periods to ensure that a variety of random occurrences that could result from the stochastic nature of the software program were captured and to ensure that an appropriate sample size was used to average the output results of the different Measures of Effectiveness (MOEs) used in the analysis. Model links were sorted and aggregated to make up each freeway, ramp, and arterial segment. Network inputs were reviewed in the single-run output file for correctness and the modeled peak-hour volumes were compared to the demand volumes. In cases where there was a high percent error between the modeled volumes and demand volumes, the models were checked for volume input errors and other link coding errors that could lead to high percent errors. The calibration process was initiated after the models were determined to be free of errors.

4.0 CORSIM Model Calibration

Volume was used as the primary calibration target and travel times were used as the secondary calibration target. A visual inspection of queuing patterns was performed to ensure reasonableness. Note that NETSIM link information is not included in the results of the calibration process as the focus of the project is on freeway improvements. Crossing arterials were only included in the model to create a vehicle platooning pattern onto the freeway. However, NETSIM links were checked for coding correctness during the error checking process.

4.1 Parameter Modifications

Global factors in the models were inspected and tested to create a model that better-represented real world conditions. The output was compared between a model with and without alterations made to determine if the change in the global factor improved or worsened the model. The final result was a modification to the Pitt car-following constant. Originally a value of 10 feet, this parameter was adjusted to 9 feet in order to increase capacity, allowing more vehicles to traverse the network and lowering the amount of links with a volume discrepancy. Car-following sensitivity multipliers were not modified from the default values, ranging from 35 percent to 125 percent, as shown in **Figure 4.1**.

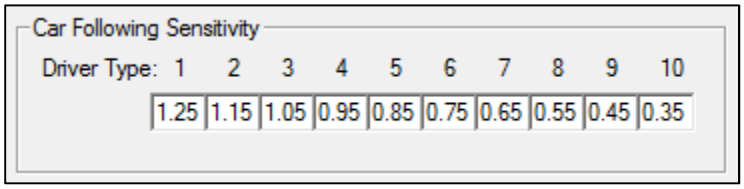

Figure 4.1. Default Car Following Sensitivity Multipliers

At the local (link-node) level, car-following sensitivity multipliers and reaction point (warning sign) distances were inspected. Greater link car-following sensitivity multipliers indicate a desire for greater headway between vehicles that result in slower moving traffic and increased congestion. Car-following sensitivity-multiplier adjustments primarily focus on areas with observed congestion. These multipliers were left unaffected due to the effectiveness of altering the Pitt car-following constant. Car-following sensitivity multipliers for links vary between models to capture variations in congestion within the various times of the day.

The warning sign distances for exit ramps and the anticipatory lane change positions for entrance ramps were reviewed. Changes to warning sign locations impact lane-changing behavior. In many cases, the warning sign locations are dictated by the network geometry since they were placed at locations that would allow for realistic volume throughput instead of placing them for proper lane utilization far upstream. The speed thresholds for initiating lane changes and the reaction distance near entrance ramps varied throughout the model. The default warning sign distances in the CORSIM models were used as the lane-changing behavior appeared to be realistic as compared to field observations.

4.2 Volume Calibration Results

Volume was used as a primary measure to calibrate the existing year (2012) CORSIM models. The output of each of the twelve time periods was averaged among all ten runs. The average volumes of the peak hour were then totaled to get the volume for each link. The modeled peak-hour volumes,

comprised of volumes extracted from time periods five through eight, were compared to the peak-hour demand volumes during the calibration process. The difference in vehicles or the percent difference between modeled and demand volumes were compared to the FHWA TAT[3] acceptable thresholds. Individual link flow calibration has three criteria that vary based on the magnitude of the demand volume and one based on the Geoffrey E. Havers (GEH) statistic, which is calculated as:

$$GEH = \sqrt{\frac{(E-V)^2}{(E+V)/2}}$$

where:

$E = model\ estimated\ volumes$

$V = field\ count$

The individual link flow calibration thresholds are as follows:

- If the demand volume is less than 700 veh/hr, then the difference between measured volumes and modeled volumes should be less than 100 veh/hr.
- If the demand volume is between 700 and 2,700 veh/hr, then the percent difference between measured volumes and modeled volumes should be less than fifteen percent.
- If the demand volume is greater than 2,700 veh/hr, then the difference between measured volumes and modeled volumes should be less than 400 veh/hr.
- The GEH statistic should be less than 5.

The individual link flow calibration thresholds must be met for 85 percent of all links for each criterion. The total network is considered to be calibrated when the sum of all modeled link volumes is within 5 percent of the sum of all counts and when the GEH statistic is less than 4. The volume calibration results can be found in **Attachment C** for both the AM and PM peak periods. All links were within the acceptable error thresholds in both the AM and PM CORSIM models.

4.3 Travel Time Calibration Results

Travel times were used as a secondary measure to calibrate the existing year (2012) CORSIM models. Since there was not substantial variability between each individual field-measured travel time run, the average of the field-measured travel time runs on each segment was used in the calibration. The percent difference between modeled and field-measured travel times were compared to the FHWA TAT[3] acceptable threshold of a 15 percent difference for 85 percent of the links or one minute. The travel time limits in the CORSIM model are comprised of multiple links. Travel time output from the CORSIM models were aggregated for comparison with the field-measured travel times. The limits of the travel time runs are similar between the true roadway segment and the CORSIM modeled network. Travel times on three of the four segments from the CORSIM model reasonably replicated the travel times measured in the field with percent differences less than 7.0 percent for both the AM and PM peak periods.

One segment in the CORSIM model did not produce results as observed on southbound I-275 from the Roosevelt Boulevard on ramp to the Gandy Boulevard off ramp in the PM peak period. Congestion was experienced during the PM peak period travel time run in the field, causing the

difference between field-measured and modeled travel times to nearly double. One possible explanation for why the southbound I-275 observed travel times were not able to be adequately replicated in the PM CORSIM model is that design hour volumes were provided by the FDOT and, therefore, raw counts measured simultaneously with the travel time data collection were not used in the calibration process. The time-space trajectories of the AM and PM peak period travel times using GPS data loggers and the existing year (2012) CORSIM model are presented graphically in **Figure 4.2**, **Figure 4.3**, **Figure 4.4**, and **Figure 4.5**. The volume calibration results can be found in **Attachment D** for both the AM and PM peak periods.

4.4 Queuing Calibration Results

The locations of modeled congestion are comparable to those captured during the field observations, with the exception of southbound I-275 during the PM peak period. A visual observation of the queuing patterns in the CORSIM models was performed for comparison with the queuing field data. One limitation in matching observed queuing and congestion within the CORSIM model to field-measured data is that design hour volumes were provided by the FDOT and, therefore, raw counts measured simultaneously with the queue data collection were not used in the calibration process. This is a possible explanation for why the southbound I-275 observed congestion was not able to be adequately replicated in the PM CORSIM model. All other queuing observations appeared to be reasonable. Congestion was observed along various locations of I-275 throughout the modeling area during both the AM and PM peak periods. Most freeway entrance and exit ramps had limited queuing and did not impact mainline or cross-street operations. Queue data can be found in **Attachment A**.

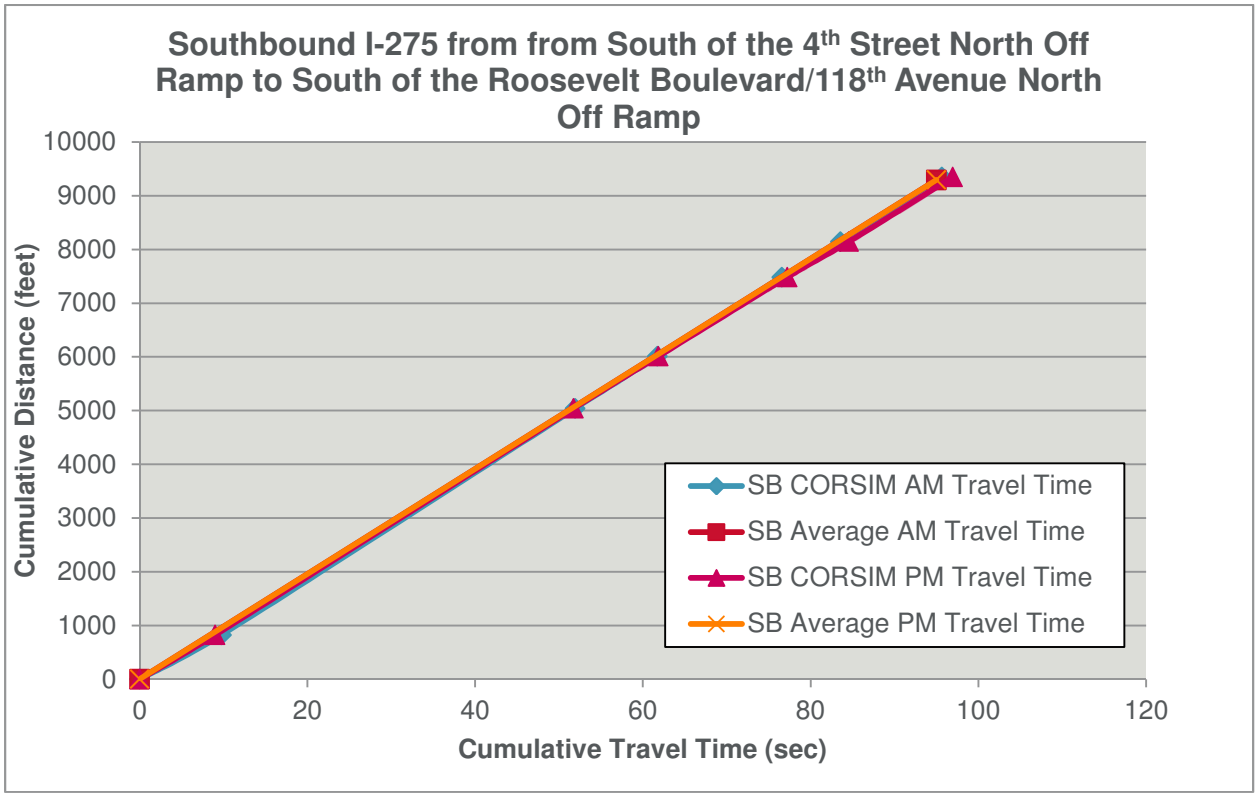

Figure 4.5. Travel Times on Southbound I-275 – Segment 2

5.0 Conclusions

The first step in conducting the CORSIM analyses for each scenario was to develop calibrated existing year (2012) AM and PM models. The models were created with existing signal timings, free flow speeds, and traffic volumes provided by FDOT. Global and local modifications were made where necessary until the existing year (2012) CORSIM models were calibrated within the allowable percent error thresholds set forth in the FHWA TAT[3] for travel time and volume. The models were also visually inspected for reasonable queuing patterns. The final modified global and local inputs and modeling procedures specified in Section 4.1 that were used in the calibrated models were also used in the design year (2040) No Build and Master Project, opening year (2020) Starter Project, and interim year (2030) Starter Project CORSIM models for both the AM and PM peak period scenarios.

Project Description I-275 Managed Lanes

Inputs

Upstream Adj Ramp
☐ Yes ☐ On
☑ No ☐ Off
L_{up} = ft
V_u = veh/h

Freeway Number of Lanes, N	3
Ramp Number of Lanes, N	1
Acceleration Lane Length, L_A	
Deceleration Lane Length L_D	195
Freeway Volume, V_F	6352
Ramp Volume, V_R	1104
Freeway Free-Flow Speed, S_{FF}	70.0
Ramp Free-Flow Speed, S_{FR}	50.0

Downstream Adj Ramp
☑ Yes ☐ On
☐ No ☑ Off
L_{down} = 750 ft
V_D = 1278 veh/h

Conversion to pc/h Under Base Conditions

(pc/h)	V (Veh/hr)	PHF	Terrain	%Truck	%Rv	f_{HV}	f_p	v = V/PHF x f_{HV} x f_p
Freeway	6352	0.95	Level	3	0	0.985	0.98	6925
Ramp	1104	0.95	Level	3	0	0.985	0.98	1204
UpStream								
DownStream	1278	0.95	Level	3	0	0.985	0.98	1393

Merge Areas

Estimation of v_{12}

$V_{12} = V_F (P_{FM})$
L_{EQ} = (Equation 13-6 or 13-7)
P_{FM} = using Equation (Exhibit 13-6)
V_{12} = pc/h
V_3 or V_{av34} pc/h (Equation 13-14 or 13-17)
Is V_3 or V_{av34} > 2,700 pc/h? ☐ Yes ☐ No
Is V_3 or V_{av34} > 1.5 * V_{12}/2 ☐ Yes ☐ No
If Yes,V_{12a} = pc/h (Equation 13-16, 13-18, or 13-19)

Capacity Checks

	Actual	Capacity		LOS F?
V_{FO}		Exhibit 13-8		

Flow Entering Merge Influence Area

Development of AADT (Average Annual Daily Traffic) &

DDHV (Directional Design Hourly Volumes)

FDOT District 7 Managed Lanes Projects

March, 2014

Purpose

The purpose of this memorandum is to document the procedure used to determine existing and future volumes for the proposed District Seven Managed Lanes Network. Three alternatives were examined for this study:

No-Build conditions,

Starter Projects,

Master Plan

Traffic volumes for the Build alternative were developed for three design years of 2020, 2030, and 2040.

Project Alternatives

Three analyzed alternatives are described below:

(a). No-Build Conditions

The No-Build for the future design year consists of the existing geometry, on-going construction, and committed improvements. No express lanes exist in the No-Build network.

(b). Starter Projects

The Starter Project Network consists of express lanes (one lane per direction) on portions of I-275, I-4, and I-75. The only exception to the one-lane configuration is along I-275 from SR 60 to Armenia Avenue/Howard Avenue, where two express lanes per direction are included. The express lane network is based upon the Starter Project roll plot concept plans provided in August/September 2013 and refined in January 2014 to include direct managed lanes connections for the I-275/SR 60 interchange. On I-275, express lanes extend from 118th Street to Willow Avenue (including segments that pass over the Howard Frankland Bridge), and from north of downtown Tampa and to north of Bearss Avenue. On I-4, express lanes extend from the Crosstown Connector to Mango Road. On I-75, express lanes extend from north of SR 60 to north of Bruce B. Downs Boulevard.

(c). Master Plan

The Master Plan consists of express lanes (two lanes per direction) on portions of I-275, I-4, and I-75.

The exception is on I-275 from SR 60 (Memorial Highway) to the I-4/I-275 junction and on I-4 at this junction to the Crosstown Connector where three lanes per direction are included. On I-275, the express lanes start in the vicinity of Gandy Boulevard and continue to north of Bearss Avenue. The express lanes on I-4 start at the I-4/I-275 junction and continue eastward to the Polk Parkway. The I-75 express lanes start in the vicinity of SR 674 and continue to north of SR 581 (Bruce B. Downs Boulevard). The express lane network is based on concept plans provided in August/September 2013 and refined in January 2014 to include direct managed lanes connections for the I-275/I-4 interchange

Existing Traffic Volumes

Existing AM/PM peak hour volumes were obtained from the FDOT 2012 DVD and were supplemented by additional counts conducted by District Seven and by URS. Where multi-day counts were available, an average was developed to reflect daily fluctuations in traffic volume. Additionally, the various traffic counts were collected throughout a year; therefore, seasonal factors were applied to reflect seasonal fluctuations. As a result of balancing throughout the network, the existing volumes may slightly deviate from the counts.

Key Steps in the Development of Future Traffic Volumes

The key steps in developing the design years 2020, 2030, and 2040 volumes are described as follows:

a. The TBRPM-ML Time of Day Model was used to obtain year 2035 volumes. AADTs and AM/PM peak period volumes were obtained from the time of day model as the basis to develop future volumes. The peak period volumes were converted to peak hour volumes by applying factors of 0.41 to the AM peak period and of 0.35 to the PM peak period. An area MOCF[1] factor of 0.95 was used to convert daily model outputs to AADTs. .

b. In order to develop traffic projections for 2020, 2030 and 2040, annual growth rates were calculated by comparing the existing AADT and the model year 2035 AADT. **Tables 1** through **3** display the calculated annual 2012-2035 growth rates. Freeway mainline segments were grouped into five subareas:
    - I-275 Pinellas County,
    - I-275 in the Tampa Interstate Study (TIS) area,
    - I-275 North of Martin Luther King Jr. Blvd,
    - Interstate 4, and
    - Interstate 75.

[1] The MOCF (Model Output Conversion Factor) is used to convert the peak season traffic volumes generated by a travel demand forecasting model (PSWADT) to AADT

An average growth rate was calculated for each individual sub-area. Accordingly, an adjustment factor was calculated for each analysis year (2020, 2030 or 2040) and the year 2035 AADT was multiplied by that factor to develop 2020, 2030 or 2040 projections.

c. In order to display reasonable traffic growth from the existing condition up to the year 2040, manual adjustments were applied for freeway segments and ramps where design year volumes were found lower than the existing conditions. A complete reasonableness check was conducted to ensure a reasonable traffic growth progression between the existing condition and 2040.

Table 1 Adjustment Factors

Traffic Noise Data

TRAFFIC DATA FOR NOISE STUDIES

Page 1

Project: I-275 (SR 93) Pinellas PD&E Study

State Project Number(s):

Financial Project ID: 424501-1-22-01

Federal Aid Number(s): TBD

Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015

Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)

NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 1

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 2

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 2

Project: Project: I-275 (SR 93) Pinellas PD&E Study

State Project Number(s): State Project Number(s):

Financial Project ID: Financial Project ID: 424501-1-22-01

Federal Aid Number(s): Federal Aid Number(s): TBD

Segment Description: Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015

Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)

NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES

Page 1

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)

NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 2

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 2

Project: Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s): State Project Number(s):
Financial Project ID: Financial Project ID: 424501-1-22-01
Federal Aid Number(s): Federal Aid Number(s): TBD
Segment Description: Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

TRAFFIC DATA FOR NOISE STUDIES
Page 1

Project: I-275 (SR 93) Pinellas PD&E Study

State Project Number(s):

Financial Project ID: 424501-1-22-01

Federal Aid Number(s): TBD

Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015

Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)

NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

Project: I-275 (SR 93) Pinellas PD&E Study
State Project Number(s):
Financial Project ID: 424501-1-22-01
Federal Aid Number(s): TBD
Segment Description: I-275 (SR 93) from south of 54th Avenue South to north of 4th Street North

Date: 3/5/2015
Prepared By: HDR

(Data sheets are to be filled out for every segment having a change in traffic parameters such as volumes, posted speeds, typical section, etc.)
NOTE: Modeled ADT is the LOS(C) volume referenced in the FDOT LOS tables or demand, whichever is less.

Project Description *I-275 Managed Lanes*

☑ Oper.(LOS) ☐ Des.(N) ☐ Planning Data

Flow Inputs

Volume, V	*3570*	veh/h	Peak-Hour Factor, PHF	*0.95*
AADT		veh/day	%Trucks and Buses, P_T	*2*
Peak-Hr Prop. of AADT, K			%RVs, P_R	*0*
Peak-Hr Direction Prop, D			General Terrain:	*Level*
DDHV = AADT x K x D		veh/h	Grade % Length Up/Down %	*mi*

Calculate Flow Adjustments

f_p	*0.98*	E_R	*1.2*
E_T	*1.5*	$f_{HV} = 1/[1+P_T(E_T - 1) + P_R(E_R - 1)]$	*0.990*

Speed Inputs

Lane Width	*12.0*	ft
Rt-Side Lat. Clearance	*6.0*	ft
Number of Lanes, N	*2*	
Total Ramp Density, TRD	*1.17*	ramps/mi
FFS (measured)		mph
Base free-flow Speed, BFFS	*75.4*	mph

Calc Speed Adj and FFS

f_{LW}	*0.0*	mph
f_{LC}	*0.0*	mph
TRD Adjustment	*3.7*	mph
FFS	*71.7*	mph

LOS and Performance Measures

Operational (LOS)

v_p = (V or DDHV) / (PHF x N x f_{HV} x f_p)	*1936*	pc/h/ln
S	*63.7*	mph
D = v_p / S	*30.4*	pc/mi/ln
LOS	*D*	

Design (N)

Design (N)

Design LOS	
v_p = (V or DDHV) / (PHF x N x f_{HV} x f_p)	pc/h/ln
S	mph
D = v_p / S	pc/mi/ln
Required Number of Lanes, N	

Glossary

N - Number of lanes	S - Speed
V - Hourly volume	D - Density
v_p - Flow rate	FFS - Free-flow speed
LOS - Level of service	BFFS - Base free-flow speed
DDHV - Directional design hour volume	

Factor Location

E_R - Exhibits 11-10, 11-12	f_{LW} - Exhibit 11-8
