# ***EXECUTIVE SUMMARY***

---

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study to consider the proposed widening of a portion of US 301 (Gall Boulevard) from a two-lane road to a four-lane road. Located in Pasco County, the limits of the study are from the proposed State Road (SR) 56 to the proposed realignment of SR 39.

This *Draft Noise Study Report (NSR)* was prepared as part of the PD&E Study for the project as required by the FDOT's PD&E Manual, Part 2, Chapter 17 (May 4, 2011) and in accordance with the Title 23, Part 772 of the Code of Federal Regulations (23 CFR 772)-Procedures for Abatement of Highway Traffic Noise and Construction Noise (July 13, 2010).

One hundred twenty-one noise sensitive receptors (i.e., discrete representative locations on a property that has noise sensitive land uses) were evaluated within eight noise sensitive areas. One hundred eighteen receptors were evaluated on residential properties, two at residential community pools and one at a residential community shuffleboard court.

Of the 121 evaluated receptors, 41 are predicted to be impacted by traffic noise with existing conditions and in the future without the proposed improvements. With the proposed improvements, 70 of the 121 receptors are predicted to be impacted by traffic noise. Of the 70 receptors predicted to be impacted with the proposed improvements, 69 were evaluated on residential properties and one was evaluated at the shuffleboard court.

Traffic management measures, modifications to the roadway alignment, buffer zones and noise barriers were considered as abatement measures. With the exception of the proposed noise barriers for the impacted properties within the following areas, the noise abatement measures were not determined to be both feasible and reasonable.

- Barrier 1: Residences at the Palm View Gardens RV Park (Receptors 4-59, 64, 66, 72, 73, and 77)
- Barrier 3: Residences at the Shady Oaks Mobile Home Park (Receptors 86-93)

The estimated cost to construct the noise barriers ranges from \$212,100 to \$917,400 depending on barrier length and height.

The FDOT is committed to the construction of noise barriers at the two locations above, contingent upon the following:

- Detailed noise analysis during the final design process supports the need for, and the feasibility and reasonableness of providing the barriers as abatement
- The detailed analysis demonstrates that the cost of the noise barrier will not exceed the cost effective limit
- The residents/property owners benefitted by the noise barrier desire that a noise barrier be constructed
- All safety and engineering conflicts or issues related to construction of a noise barrier are resolved

# *Section 1.0*

## ***PROJECT DESCRIPTION***

---

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study to consider the proposed widening of a portion of US 301 (Gall Boulevard). The PD&E Study includes a State Environmental Impact Report (SEIR) for the study corridor. Located in Pasco County, the limits of this study are the proposed future connection of State Road (SR) 56 on the south (approximately Mile Post (MP) 1.600) to just south of the proposed future realigned SR 39 (Buchman Highway) intersection on the north (MP 3.554), a distance of approximately two miles. The project location map is included as **Figure 1-1**.

### ***1.1 EXISTING CONDITIONS***

The existing US 301 (Gall Boulevard) corridor within the study area is currently a two-lane undivided north/south facility. Within the study area, US 301 (Gall Boulevard) is functionally classified as:

- **Rural Principal Arterial - Other** from MP 1.600 (project southern termini) to MP 2.452 (just north of Shamrock Place), for a distance of 0.852 mile, and
- **Urban Principal Arterial - Other** from MP 2.452 (just north of Shamrock Place) to MP 3.554 (project northern termini), for a distance of 1.102 mile.

The existing posted speed limit is 55 miles per hour (mph) south and 45 mph north of Chancey Road, respectively. The existing right-of-way (ROW) width is approximately 100 feet. **Figure 1-2** depicts the existing roadway typical section.

### ***1.2 PROPOSED IMPROVEMENTS***

The proposed improvements would consist of two typical sections, both of which are suburban typicals. The first typical section (**Figure 1-3**) would have:

- Four, 12-foot lanes;
- A 54-foot median;
- Two, 7-foot paved shoulders that could also be used by bicycles;
- Type E curbs and gutters; as well as,
- 5-foot sidewalks.

This typical section begins at the future SR 56 intersection and ends at Chancey Road. In addition, this typical section is expandable to six lanes by adding two lanes to the inside reducing the overall median width to 24 feet.

The second typical section (**Figure 1-4**) consists of four, 11-foot lanes; a variable width median; two, 7-foot paved shoulders that could be used for bicycles and bordered by Type E curb and gutter; as well as, two, 5-foot sidewalks. This typical section would serve as a transition between US 301 (Gall Boulevard) and the ultimate 4-lane section of US 301 (Gall Boulevard) that begins just south of the proposed realigned SR 39 (Buchman Highway) intersection at US 301 (Gall Boulevard). Both typical sections would hold the existing west ROW line and expand the project corridor to the east.

Proposed improvements include: widening US 301 (Gall Boulevard) to four lanes, as well as intersection improvements at the following Intersections.

- US 301 (Gall Boulevard) and Chancey Road
- US 301 (Gall Boulevard) and the Proposed SR 56

Improvements would also include stormwater management facilities and floodplain compensation sites.

# ***Section 2.0***

## ***PROJECT PURPOSE AND NEED***

---

### ***2.1 REGIONAL CONNECTIVITY***

US 301 (Gall Boulevard) is a major north-south arterial located in East Pasco County. It is a regional truck route and provides excellent north-south access to distribution centers. US 301 (Gall Boulevard) is an important connection to the regional and statewide transportation network that links the Tampa Bay region to the remainder of the state and the nation. US 301 (Gall Boulevard) was identified as a regional roadway by the West Central Florida Metropolitan Planning Organizations (MPOs) Chairs Coordinating Committee (CCC) and included in the Regional Roadway Network. As shown in **Section 2.5**, the 2040 design year expected Average Annual Daily traffic (AADT) is 39,500 vehicles per day (vpd). The measured percentage of daily truck traffic is 15.10 percent. Therefore, the projected truck traffic on US 301 (Gall Boulevard) is approximately 6,000 trucks per day in 2040.

### ***2.2 PLAN CONSISTENCY***

The widening of US 301 (Gall Boulevard) from SR 56 (Proposed) to the proposed realignment of SR 39 (Buchman Highway) is identified as a ‘Cost-Affordable Capital Improvement’ (construction 2031 – 2040) in the *Pasco County MPO Mobility 2040*. The project has also been identified on the latest *Pasco County Transportation Capital Improvement Projects (2014-2028)* map. It should additionally be noted that \$2.5 million is programmed for the design phase in Fiscal Year (FY) 2018 within the FDOT Five Year Work Program. Further, the project is reflected on *Map 7-22: Future Number of Lanes (2035)* in the Transportation Element of the adopted Pasco County Comprehensive Plan.

### ***2.3 EMERGENCY EVACUATION***

US 301 (Gall Boulevard) is designated as a parallel evacuation route to I-75 for the length of Pasco County.

### ***2.4 FUTURE POPULATION AND EMPLOYMENT GROWTH IN CORRIDOR***

In the Tampa Bay Regional Planning Model for Managed Lanes (TBRPM-ML) “Starter Projects” Traffic Analysis Zones (TAZs) located within one quarter-mile of the US 301 (Gall Boulevard) project corridor were used to document the socioeconomic data. The study area’s population is projected to grow from 4,973 in year 2006 to 13,638 in year 2035 (an increase

of 8,665). Employment is also expected to increase during the same period from 1,337 to 5,392 (an increase of 4,055).

## 2.5 FUTURE TRAFFIC

In 2013, US 301 (Gall Boulevard) from Chancey Road to SR 39 (Buchman Highway) carried 12,500 vpd. By the design year 2040, segments within this section of US 301 (Gall Boulevard) are expected to reach a volume of 39,500 vpd. The roadway segment was analyzed using the FDOT’s HIGHPLAN software which incorporates methodologies contained within the 2010 Highway Capacity Manual (HCM) 2010. Based on this analysis, the existing level of service (LOS) is C. Without the proposed improvement, the operating conditions will continue to deteriorate to a failing LOS of F. With the proposed improvement to widen this roadway to four lanes and other proposed improvements, the LOS for 2040 is projected to be C; with one exception in the northbound PM peak hour, the LOS would be D.

## 2.6 SAFETY

For the five-year period (2009-2013), there were 84 crashes reported along the corridor with an average of 16.8 crashes per year. Rear-end collisions were the most common crash type recorded for the corridor with 43 or 51.2 percent of total crashes, followed by 17 angle collisions (including two left-turn collisions) or 20.2 percent of the total crashes. Out of the 84 total crashes, 47 or 56.0 percent were crashes with injuries and 35 or 41.7 percent were crashes with property damage only.

Source: FDOT Unified Base Map Repository, 2014.

There were two fatal crashes recorded along the US 301 (Gall Boulevard) corridor (2.3 percent). Further, four out of 84 total crashes (4.8 percent) were related to medium or heavy trucks. Among the truck-related incidents, three crashes involved injuries.

Safety within the US 301 (Gall Boulevard) corridor would be enhanced due to the additional capacity that would be provided. Roadway congestion would be reduced, thereby decreasing potential conflicts with other vehicles.

## **2.7 TRANSIT**

The existing Pasco County Public Transportation (PCPT) bus Route 30 terminates at Tucker Road just north of the study area, and serves activity centers to the north including downtown Zephyrhills and Dade City from 4:45 am to 7:45 pm. In addition, this segment of US 301 (Gall Boulevard) to downtown Zephyrhills is part of the proposed SR 54 Cross County Express Route that is included in the *Pasco County's Mobility 2040 Cost Affordable Transit Plan* for implementation in 2031. Also planned is a Major Transit Station/Stop and Transit Signal Priority (TSP) along the corridor.

## **2.8 ACCESS TO INTERMODAL FACILITIES AND FREIGHT ACTIVITY CENTERS**

Access to intermodal facilities and movement of goods and freight are important considerations in the development of the Pasco County transportation system. US 301 (Gall Boulevard) is a regional truck route. The Zephyrhills Airport Industrial Area, a designated freight activity center, is located just northeast of the northern terminus of the study area. This industrial area has five major manufacturing facilities with approximately 700,000 square feet of industrial space. These companies generate approximately 200 trucks per day. Improvements to US 301 (Gall Boulevard) would enhance access to activity centers in the area and the movement of freight in eastern Pasco County.

## **2.9 RELIEF TO PARALLEL FACILITIES**

The planned widening of US 301 (Gall Boulevard) between Chancey Road and the proposed realigned SR 39 (Buchman Highway) intersection is part of an overall plan to improve access and relieve traffic congestion on such parallel facilities as I-75, the Suncoast Parkway, and US 41. Safety, emergency access, and truck access would all be enhanced by this improvement.

## **2.10 BIKEWAYS AND SIDEWALKS**

Integration of bicycle facilities and sidewalks are planned on all Pasco County and state road projects; including, new roads, widening of existing roads, and the resurfacing of state roads. These projects are planned to be constructed to include a minimum of a 7-foot wide paved shoulder to allow for bicycle safety.

## *Section 3.0*

# *ALTERNATIVES CONSIDERED*

---

The US 301 (Gall Boulevard) PD&E study originally considered two alternatives. These include:

### **No Build Alternative:**

The No-Build Alternative assumes that traffic volumes will continue to increase with no changes to US 301 within the study area. The No-Build Alternative requires no additional expenditure of funds and has no environmental impacts. Although the No-Build Alternative does not meet the purpose and need and offers no future operational improvements, it will remain a viable alternative throughout the study process and serve as the basis of comparison for the build alternatives.

### **Build Alternative:**

As shown in the Typical Section **Figure 1-3**, the Build Alternative improvements would consist of two suburban typical sections. The first typical section beginning at the future SR 56 intersection and ending at Chancey Road would have: four 12-foot lanes; a 54-foot median; two 7-foot paved shoulders that could also be used by bicycles and Type E curbs and gutters; as well as, 5-foot sidewalks. This typical section is expandable to six lanes by adding two lanes to the inside reducing the overall medium width to 24 feet.

The second typical section begins at Chancey Road and ends just south of the proposed realigned SR 39 (Buchman Highway) intersection at US 301 (Gall Boulevard) and is shown in **Figure 1-4**. This typical section consists of four 11-foot lanes, variable width median, and two 7-foot paved shoulders that could be used for bicycles and bordered by Type E curb and gutter; as well as two 5-foot sidewalks. This typical section would serve as a transition between the ultimate 6-lane section of US 301 (Gall Boulevard) and the ultimate 4-lane section of US 301 (Gall Boulevard). Both typical sections would hold the existing west ROW line and expand the project corridor to the east.

# *Section 4.0*

## ***METHODOLOGY***

---

This traffic noise analysis has been prepared in accordance with all applicable guidelines as stated within both 23 CFR 772 and Part 2, Chapter 17 of the FDOT PD&E Manual. As such, the analysis was performed using the Federal Highway Administration (FHWA)'s Traffic Noise Model (TNM, Version 2.5). Use of the TNM is required when evaluating the potential for traffic noise impacts during the design year of roadway improvement projects for which the regulations, policies and guidelines with 23 CFR 772 and Part 2, Chapter 17 of the PD&E Manual are applicable.

For properties with uses other than residential, the methodologies described in the FDOT's *A Method to Determine Reasonableness and Feasibility of Noise Abatement at Special Use Locations* were also used. Special land uses include community pools and recreational areas.

### ***4.1 NOISE METRICS***

The predicted traffic noise levels presented in this report are expressed in decibels on the "A"-weighted scale (dB(A)). This scale most closely approximates the response characteristics of the human ear to traffic noise. All traffic noise levels are reported as equivalent levels (Leq(h)). Levels reported as Leq(h) are equivalent steady-state sound levels that contain the same acoustic energy as time-varying sound levels over a period of one hour.

### ***4.2 TRAFFIC DATA***

Noise levels are low when traffic volumes are low and operating conditions are good (LOS A or B) and when traffic is so congested that movement is slow (LOS D, E, or F). Generally, the maximum hourly noise level occurs between these two conditions (i.e., LOS C).

The traffic volumes used in the analysis were either the roadway design LOS C volume or the forecast demand volume, whichever was less, so that the predicted traffic noise levels with the improvements to US 301 (Gall Boulevard) represent the maximum hourly noise level during the project's design year. The Existing (year 2013), Future No-Build (year 2040) and Future Build (year 2040) traffic data used in the analysis are provided in **Appendix A** of this Draft Noise Study Report (NSR).

### **4.3 NOISE ABATEMENT CRITERIA**

For the purpose of evaluating traffic noise, the FHWA established Noise Abatement Criteria (NAC). As shown in **Table 4-1**, these criteria vary according to a properties' activity category (i.e., land use). For comparative purposes, typical noise levels for common indoor and outdoor activities are provided in **Table 4-2**.

When predicted traffic noise levels “approach” or exceed the NAC, or when predicted future noise levels increase substantially from existing levels, the FHWA requires that noise abatement measures be considered. FDOT defines the word “approach” to mean within 1 dB(A) of the NAC. The FDOT’s NAC are also shown in Table 4-1.

FHWA regulations also state that a traffic noise impact is predicted to occur when predicted traffic noise levels with a proposed improvement are considered substantial when compared to existing levels. The FDOT considers a substantial increase to be when traffic noise levels are predicted to increase 15 dB(A) or more above existing conditions as a direct result of a transportation improvement project.

### **4.4 NOISE ABATEMENT MEASURES**

When traffic noise impacts are predicted, noise abatement measures are considered for the impacted properties and the feasibility and reasonableness of providing an abatement measure are considered. Feasibility factors are related to the acoustical and engineering properties of an abatement measure while reasonableness factors relate to the social, economic and environmental properties of a measure.

The following subsections of this NSR present and discuss four methods of abating traffic noise impacts.

**TABLE 4-1  
FHWA/FDOT NOISE ABATEMENT CRITERIA**

ACTIVITY CATEGORY	DESCRIPTION OF ACTIVITY CATEGORY	ACTIVITY Leq(h) <sup>1</sup>	
		FHWA	FDOT
A	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.	57 (Exterior)	56 (Exterior)
B <sup>2</sup>	Residential	67 (Exterior)	66 (Exterior)
C <sup>2</sup>	Active sports areas, amphitheatres, auditoriums, campgrounds, cemeteries, day care centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreational areas, Section 4(f) sites, schools, television studios, trails and trail crossings.	67 (Exterior)	66 (Exterior)
D	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools and television studios.	52 (Interior)	51 (Interior)
E <sup>2</sup>	Hotels, motels, offices, restaurants/bars and other developed lands, properties or activities not included in A-D or F.	72 (Exterior)	71 (Exterior)
F	Agriculture, airports, bus yards, emergency services, industrial, logging, maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical) and warehousing.	--	--
G	Undeveloped lands that are not permitted.	--	--

**Sources:** Table 1 of 23 CFR Part 772 and Table 17.1 of Chapter 17 of the FDOT's PD&E Manual (dated 5-24-11).

<sup>1</sup> The Leq(h) activity criteria values are for impact determination only, and are not design standards for noise abatement measures.

<sup>2</sup> Includes undeveloped lands permitted for this activity category.

*Note:* Noise abatement considerations are also warranted when a substantial noise increase is predicted to occur (i.e., when the predicted future traffic noise level with an improvement project is equal to or greater than 15 dB(A) when compared to the existing traffic noise level.

**TABLE 4-2  
TYPICAL NOISE LEVELS**

<b>COMMON OUTDOOR ACTIVITIES</b>	<b>NOISE LEVEL dB(A)</b>	<b>COMMON INDOOR ACTIVITIES</b>
	<b>110</b>	Rock band
Jet flyover at 1,000 feet	<b>100</b>

Source: KBE, 2015.

#### **4.4.1 Traffic Management**

Some types of traffic management reduce noise levels. For example, trucks can be prohibited from certain streets and roads, or be permitted to only use certain streets and roads during daylight hours. The timing of traffic lights can also be changed to smooth out the flow of traffic and eliminate the need for frequent stops and starts. Speed limits can also be reduced.

#### **4.4.2 Alignment Modifications**

Modifying the horizontal and/or vertical alignment of a roadway can also be an effective traffic noise mitigation measure. When the horizontal alignment is shifted (i.e., moved) away from a noise sensitive property or when the vertical alignment is shifted below (i.e., placing the roadway below the elevation of a noise sensitive land use) or above a noise sensitive property.

#### **4.4.3 Buffer Zones**

Providing a buffer between a roadway and noise-sensitive land uses is an abatement measure that can minimize/eliminate noise impacts. To abate traffic noise at an existing noise

sensitive land use, the property would be acquired to create a buffer zone. Buffer zones can also be used to eliminate the potential for new noise sensitive land uses to be impacted by traffic noise. For this purpose, and to encourage use of this abatement measure through local land use planning, noise contours have been developed and are further discussed in Section 5.0 of this NSR.

#### **4.4.4 Noise Barriers**

The most common type of noise abatement measure is construction of a noise barrier. Noise barriers have the potential to reduce traffic noise levels by blocking the sound path between the motor vehicles on the roadway (the source) and the noise-sensitive land uses adjacent to the roadway.

In order to effectively reduce traffic noise, a noise barrier must be relatively long, continuous (without intermittent openings) and sufficiently tall. For a noise barrier to be considered a potential abatement measure the barrier must also provide the following noise reduction requirements:

- **Minimum Noise Reduction Requirements** - A barrier must provide at least a 5 dB(A) reduction in traffic noise for two or more impacted noise-sensitive receptors and also provide at least a 7 dB(A) reduction (i.e., the FDOT's noise reduction design goal) for at least one impacted receptor. Receptors are discrete representative locations on a property that has noise sensitive land uses (see Table 4-1).

The cost of a noise barrier must also be reasonable. For this purpose, the FDOT established the following cost effective limit:

- **Cost Effective Limit** – At a cost of \$30 per square foot, a barrier should not cost more than \$42,000 per benefited noise sensitive receptor (a benefited receptor is one that receives at least a 5 dB(A) reduction in noise from a mitigation measure). For special land uses (e.g., the outdoor eating area of a restaurant), the cost of a barrier is based on the number of people using the impacted and benefitted area.

If the results of the preliminary analysis indicate that a noise barrier would provide the required reduction in traffic noise at a cost at or below the cost effective limit, additional factors are then considered. These factors relate to barrier design and construction (i.e., given site-specific details, can a barrier actually be constructed), safety, access to and from adjacent properties, ROW requirements, maintenance and impacts on utilities and drainage amongst other factors. The viewpoint of the impacted property owners (and renters if applicable) who may, or may not, desire a noise barrier, is also a factor that is considered when evaluating noise barriers as an abatement measure.

# *Section 5.0*

## *TRAFFIC NOISE ANALYSIS*

---

### **5.1 NOISE SENSITIVE RECEPTORS**

As previously stated, noise sensitive receptors are representative locations of a noise sensitive land use. The location of the receptors evaluated for the US 301 (Gall Boulevard) improvements are shown on aerials provided in **Appendix B**. One-hundred-twenty-one noise sensitive receptors (i.e., discrete representative locations on a property that has noise sensitive land uses) were evaluated within eight noise sensitive areas. One-hundred-eighteen receptors were evaluated on residential property, two were evaluated at community pools located at the Palm View Gardens RV Resort and Bramblewood Mobile Home Park and one receptor was evaluated at the shuffleboard court at the Palm View Gardens RV Resort.

**Table 5-1** lists and describes each area and provides the number of evaluated noise sensitive receptors.

**TABLE 5-1  
NOISE SENSITIVE AREAS**

NAME AND/OR LOCATION OF NOISE SENSITIVE PROPERTIES	SHEET NO. (SEE APPENDIX B)	ACTIVITY CATEGORY	NUMBER OF EVALUATED RECEPTORS
Tropical Acre Estates	3	B – Residential	2
Isolated Residence	3	B – Residential	1
Palm View Gardens RV Resort	4	B – Residential	77
		C – Recreational Area (Pool)	1
		C – Recreational Area (Shuffleboard Court)	1
Shady Oaks Mobile Home Park	8	B – Residential	27
Sunset RV Park	8	B - Residential	5
Ramblewood Mobile Home Park	8	B - Residential	6
		C –Recreational Area (Pool)	1
<b>Total</b>			<b>121</b>

**Source:** KBE, 2015.

Following FHWA/FDOT guidance, the residences were evaluated as Activity Category “B” (i.e. abatement considered at a predicted traffic noise of 66 dB(A)). The areas of use at the pools and shuffleboard court were evaluated as Activity Category “C” (i.e., abatement considered at a predicted traffic noise level of 66 dB(A)).

## 5.2 MEASURED NOISE LEVELS

Both existing and future noise levels (with and without the proposed improvements) were modeled using the TNM. To verify the accuracy of the predictions, the computer model was validated using field measured noise levels adjacent to the project corridor. Traffic data including motor vehicle volumes, vehicle mix, vehicle speeds and meteorological conditions were recorded during each measurement period.

The field measurements were conducted in accordance with the FHWA’s *Measurement of Highway-Related Noise*. The measurements were obtained using a Larson Davis Model 831, Type II integrating sound level meter (SLM). The SLM was calibrated before and after the measurement period with a Larson Davis CAL200 calibrator.

The recorded traffic data were used as input for the TNM to determine if, given the topography and site conditions of the area, the computer model could “re-create” the measured levels with the existing roadway. Following FDOT guidelines, a noise prediction model is considered within the accepted level of accuracy if the measured and predicted noise levels are within a tolerance standard of 3 dB(A).

**Table 5-2** presents the field measurements and the validation results. As shown, the ability of the model to predict noise levels within the FDOT limits of plus or minus 3 dB(A) for the project was confirmed. Documentation in support of the validation is provided in **Appendix C** of this NSR.

**TABLE 5-2  
VALIDATION DATA**

LOCATION	SITE	MEASUREMENT PERIOD	MODELED (dB(A))	MEASURED (dB(A))	DIFFERENCE
Northwest side of US 301 (Gall Boulevard) southwest of the Palm View Gardens RV Resort adjacent to the Moose Lodge	1	1	68.6	69.1	-0.5
		2	68.8	68.5	0.3
		3	69.4	69.4	0.0
	2	1	70.4	69.5	0.9
		2	69.1	71.7	-2.6
		3	69.5	71.4	-1.9

## 5.3 PREDICTED TRAFFIC NOISE LEVELS

**Table 5-3** presents the results of the traffic noise analysis for the proposed improvements. As shown, of the 121 evaluated receptors, 41 are predicted to be impacted by traffic noise with existing conditions and in the future without the proposed improvements. With the proposed improvements, 70 of the 121 receptors are predicted to be impacted by traffic noise. Of the 70 receptors predicted to be impacted with the proposed improvements, 69 were evaluated for residential properties (Activity Category B) and one receptor was evaluated at the shuffleboard court in the Palm View Gardens RV Resort (Activity Category C).

## **5.4 ABATEMENT CONSIDERATIONS**

As previously stated, when traffic noise impacts are predicted, noise abatement measures are considered for the impacted properties. The following discusses the FDOT's consideration of each of the measures for which an overview was provided in Section 2.4 of this NSR.

### **5.4.1 Traffic Management**

Reducing traffic speeds and/or the traffic volume or changing the motor vehicle fleet on US 301 (Gall Boulevard) is inconsistent with the goal of improving the ability of the roadway to handle the forecast traffic volume. Therefore, traffic management measures are not considered to be a reasonable noise abatement measure for the US 301 (Gall Boulevard) project.

### **5.4.2 Alignment Modifications**

The proposed improvements to US 301 (Gall Boulevard) would be constructed within the existing ROW and following the existing horizontal alignment. Shifts in the horizontal alignment, for the purpose of minimizing potential noise impacts, would result in greater direct impacts to existing neighborhoods, wetlands and floodplains. Therefore, modifications to the horizontal alignment as a noise abatement measure, was considered to be unreasonable.

### **5.4.3 Buffer Zones**

As previously stated, to abate predicted traffic noise at an existing noise sensitive land use, the property would have to be acquired. The same cost effective limit that applies to noise barriers (i.e., \$42,000 per benefited noise sensitive receptor) would apply to the purchase price of any impacted noise sensitive property. A review of data from the Pasco Appraisers indicates that the cost to acquire the developed properties adjacent to US 301 (Gall Boulevard) exceed the cost effective limit. Therefore, creating a buffer zone by acquiring existing noise sensitive properties is not considered to be a reasonable noise abatement measure.

### **5.4.4 Noise Barriers**

The TNM was used to evaluate the ability of noise barriers to reduce traffic noise levels for the impacted noise sensitive receptors adjacent to US 301. The barriers were evaluated five feet within the FDOT's ROW at heights from eight to 22 feet (in two-foot increments). The length of each barrier was optimized to determine if at least the minimum noise reduction requirements (i.e., a minimum reduction of 5 dB(A) for two impacted receptors and a minimum reduction of 7 dB(A) for one benefitted receptor) could be achieved.

The following provides the results of the noise barrier evaluation and discusses the potential amount of noise reduction and the cost effectiveness of providing barriers as an abatement measure for the areas in which traffic noise has been predicted to impact noise sensitive properties.

**Barrier 1 - Palm View Gardens RV Resort**

A noise barrier was evaluated for the sixty-one impacted residences in the Palm View Gardens RV Resort (Receptors 4-60, 64, 66 and 72). The barrier was evaluated in two segments to accommodate access to/from the properties.

The results of the barrier analysis are provided in **Table 5-4**. As shown, at barrier heights between 8 and 22 feet, at least forty-one of the impacted residences would benefit from a reduction in traffic noise of 5 dB(A) or more, the noise reduction design goal of 7 dB(A) would be achieved and the cost of the barrier would be below the FDOT’s cost reasonable limit. Because Barrier 1 is predicted to provide the minimum noise reduction requirements at a cost below the cost effective limit, the barrier was evaluated further. The results of the evaluation are provided in **Table 5-5**.

**Barrier 2 - Palm View Gardens RV Resort Shuffleboard Court**

Barrier 2 was considered for the shuffleboard court located in Palm View Gardens RV Resort. The area of the shuffleboard closest to US 301 (Gall Boulevard) is predicted to be impacted by traffic noise. The highest predicted traffic noise level in this area is 66.9 dB(A). The FDOT’s “special land use” procedures were used to determine if a noise barrier could be considered a potential abatement measure for the impacted area. The cost of a barrier at a special land use should not exceed \$995,935 per person-hour per square foot (dollars/person-hr/ft<sup>2</sup>).

A barrier was evaluated 5 feet inside the FDOT ROW in two segments to accommodate access to/from the properties. Due to limitations on the length of the barrier segments, the noise reduction design goal of 7 dB(A) could not be achieved at any of the evaluated barrier heights. Therefore, a barrier is not considered a reasonable noise abatement measure for the impacted area of the shuffleboard court.

**Barrier 3 – Shady Oaks Mobile Home Park**

A noise barrier was evaluated for the eight impacted residences in the Shady Oaks Mobile Home Park (Receptors 86-93). The barrier was evaluated 5 feet inside the proposed FDOT ROW.

Source: KBE, 2015.

<sup>1</sup> Receptors with a predicted noise level of 66 dB(A) or greater.

<sup>2</sup> Receptors with a predicted reduction of 5 dB(A) or more are considered benefited.

<sup>3</sup> Based on a unit cost of \$30 per square foot.

<sup>4</sup> FDOT cost reasonable criterion is \$42,000 per benefited receptor.

**TABLE 5-5  
BARRIER 1: ADDITIONAL BARRIER CONSIDERATIONS**

TYPE OF FACTOR	EVALUATION CRITERIA	COMMENT
Feasibility	Design and Construction	A determination of whether a noise barrier can be constructed using standard construction methods and techniques will be made during the project's design phase. Notably, any additional costs to solely construct a noise barrier will be included in the final cost reasonableness evaluation of a noise barrier at this location.
	Safety	It does not appear that there would be any safety concerns (e.g., loss of sight distance).
	Accessibility	The barrier would be located within the FDOT's ROW for US 301 (Gall Boulevard) and would not block ingress or egress to any property.
	ROW	No acquisition of ROW or easements for construction/maintenance appear to be necessary to construct a barrier within the FDOT's ROW.
	Maintenance	The FDOT should be able to maintain a barrier at this location using standard practices.
	Drainage	A determination as to whether the barrier can be designed so that water would be directed along, under, or away from the barrier will be made during the project's design phase.
	Utilities	A determination of utility conflicts will be made during the project's design phase. Notably, there are existing poles within the FDOT ROW that may cause a conflict with a noise barrier.
Reasonableness	Community desires	The desires of the property owners and renters (if applicable) will be solicited during the design phase of the project.

Source: KBE, 2015.

The results of the barrier analysis are provided in **Table 5-6**. As shown, at barrier heights between 10 and 22 feet, at least three of the impacted residences would benefit from a reduction in traffic noise of 5 dB(A) or more, the noise reduction design goal of 7 dB(A) would be achieved and the cost of the barrier would be below the FDOT's cost reasonable limit. Because Barrier 3 is predicted to provide the minimum noise reduction requirements at a cost below the cost effective limit, the barrier was evaluated further. The results of the evaluation are provided in **Table 5-7**.

<b>TYPE OF FACTOR</b>	<b>EVALUATION CRITERIA</b>	<b>COMMENT</b>
Feasibility	Design and Construction	A determination of whether a noise barrier can be constructed using standard construction methods and techniques will be made during the project's design phase. Notably, any additional costs to solely construct a noise barrier will be included in the final cost reasonableness evaluation of a noise barrier at this location.
	Safety	It does not appear that there would be any safety concerns (e.g., loss of sight distance).
	Accessibility	The barrier would be located within the proposed FDOT's ROW for US 301 (Gall Boulevard) and would not block ingress or egress to any property.
	ROW	No acquisition of additional ROW or easements for construction/ maintenance appears to be necessary to construct a barrier within the FDOT's ROW.
	Maintenance	The FDOT should be able to maintain a barrier at this location using standard practices.
	Drainage	A determination as to whether the barrier can be designed so that water would be directed along, under, or away from the barrier will be made during the project's design phase.
	Utilities	A determination of utility conflicts will be made during the project's design phase. Notably, there are existing poles within the FDOT ROW that may cause a conflict with a noise barrier.
Reasonableness	Community desires	The desires of the property owners and renters (if applicable) will be solicited during the design phase of the project.

Source: KBE, 2015.

## *Section 6.0*

# *CONCLUSIONS*

---

As previously stated, future traffic noise levels with the proposed improvements are predicted to approach, meet, or exceed the NAC at 70 noise sensitive sites. These sites are predicted to experience future traffic noise levels with the proposed improvements to US 301 (Gall Boulevard) that would range from 66.0 to 74.4 dB(A).

The results of the evaluation indicate that construction of noise barriers is a potentially reasonable and feasible noise abatement method to reduce the predicted traffic noise levels for up to 69 of the 70 impacted sites at the following locations, as shown on maps in Appendix B:

- **Barrier 1:** Residences at the Palm View Gardens RV Park (Receptors 4-59, 64, 66, 72, 73, and 77)
- **Barrier 3:** Residences at the Shady Oaks Mobile Home Park (Receptors 86-93)

The estimated cost to construct the noise barriers ranges from \$207,720 to \$917,400 depending on barrier length and height.

### **6.1 STATEMENT OF LIKELIHOOD**

The FDOT is committed to the construction of noise barriers at the locations above, contingent upon the following:

- Detailed noise analysis during the final design process supports the need for, and the feasibility and reasonableness of providing the barriers as abatement
- The detailed analysis demonstrates that the cost of the noise barriers will not exceed the cost effective limit
- The residents/property owners benefitted by the noise barriers desire that a noise barrier be constructed
- All safety and engineering conflicts or issues related to construction of the noise barriers are resolved

# *Section 7.0*

## *NOISE CONTOURS*

---

Land uses such as residences and recreational areas are considered incompatible with highway noise levels that approach or exceed the NAC. To reduce the possibility of additional traffic noise-related impacts, noise level contours were developed for the future improved roadway facility. These noise contours delineate the extent of the predicted traffic noise impact area from the improved roadway’s edge-of-travel lane for each of the land use Activity Categories (Table 4-1). **Table 7-1** provides the distance from the edge-of-travel lane at which traffic noise levels are predicted to be 56 dB(A)—the NAC for land uses classified as Activity Category A, to 66 dB(A)—the NAC for land uses classified as Activity Category B and C, and to 71 dB(A)—the NAC for land uses classified as Activity Category E.

Local officials will be provided a copy of the Final NSR to promote compatibility between any future land developments in this area and the proposed project.

**TABLE 7-1  
NOISE CONTOUR LIMITS**

<b>US 301 (GALL BOULEVARD) ROADWAY SEGMENT</b>	<b>DISTANCE FROM IMPROVED ROADWAY’S EDGE-OF-PAVEMENT (FT)*</b>		
	<b>ACTIVITY CATEGORY A 56 dB(A)</b>	<b>ACTIVITY CATEGORY B/C 66 dB(A)</b>	<b>ACTIVITY CATEGORY E 71 dB(A)</b>
SR 56 (Proposed) to Chancey Road	480	130	95
Chancey Road to SR 39	325	110	55

**Source:** KBE, 2015.

\* See Table 4-1 for a description of the activities that occur within each category. Distances do not reflect any reduction in noise levels that would occur from existing structures (shielding) and should be used for planning purposes only.

# ***Section 8.0***

## ***CONSTRUCTION NOISE AND VIBRATION***

---

Some land uses adjacent US 301 (Gall Boulevard) are identified on the FDOT listing of noise- and vibration-sensitive sites (e.g., residential use). Construction of the proposed roadway improvements is not expected to have a significant noise or vibration effect. Additionally, the application of the ***FDOT Standard Specifications for Road and Bridge Construction*** may minimize or eliminate potential issues. Should unanticipated noise or vibration issues arise during the construction process, the Project Engineer, in coordination with the District Noise Specialist and the Contractor, will investigate additional methods of controlling these impacts.

### ***8.1 COMMUNITY COORDINATION***

Details regarding the hearing (i.e., date and location) and any traffic noise-related issues raised at the hearing will be documented in the final NSR.
