EXECUTIVE SUMMARY

The Florida Department of Transportation (FDOT) is conducting a Project Development and Environment (PD&E) Study to evaluate alternative improvements for US 41 (SR 45) from Kracker Avenue (milepoint 15.784) to south of SR 676 (Causeway Boulevard – milepoint 22.791) in Hillsborough County (**Figure 1-1)**, a distance of approximately 7.0 miles. Study objectives include: determine proposed typical sections and develop preliminary conceptual design plans for proposed improvements, while minimizing impacts to the environment; consider agency and public comments; and ensure project compliance with all applicable federal and state laws. Improvement alternatives will be identified which will improve safety and satisfy future transportation demand. A *Draft State Environmental Impact Report* (SEIR) is being prepared for this study.

Purpose and Need – The purpose of the proposed project is to accommodate future traffic demands on US 41 due to growth within the project limits and surrounding areas. This corridor is projected to operate at level of service (LOS) F in the design year (2040) if no increase in capacity is provided. Other factors which support the need for the project include: regional connectivity, safety, plan consistency, emergency evacuation, and modal interrelationships.

Existing Conditions – The existing highway is an urban principal arterial with access management classification 3 in most areas. Some areas within Gibsonton have median opening spacing that is much closer than class 3 standards. The existing highway has four-lane rural typical sections with 40-foot medians south of Palm Avenue and north of the Alafia River and four-lane urban typical sections with varying median widths between these two locations (**Figure 4-2**). The typical section between Gibsonton Drive and the Alafia River includes a ditch on the east side which is shared with the CSX railroad. Existing right of way (ROW) is 182 feet wide south of Palm Avenue and north of the Alafia River and varies from 100 to 117 feet between these two locations. The posted speed limit is 55 miles per hour (mph) south of Symmes Road and north of Riverview Drive and 50 mph between these two locations. There are a total of six signalized intersections within the study limits (excluding the intersection at Causeway Boulevard). Sidewalks and bicycle accommodations are nonexistent in some areas. The existing horizontal and vertical alignment generally meets existing design standards. The bridges over the Alafia River provide about 29 feet of vertical navigational clearance. In the rural typical section areas, drainage is provided by a system of swales and ditches. Within the urban typical section area ("north Gibsonton"), stormwater runoff from US 41 is collected by a system of underground inlets and pipes. The entire project study limits are located within FEMA 100-year Flood Zone AE ("base flood elevations determined" – **Figure 4-9**).

There are numerous utilities within the study area, including an ammonia pipeline which runs along the west side of US 41 and a Florida Gas Transmission gas pipeline which crosses US 41 at Riverview Drive.

The existing bridges over Bullfrog Creek use reinforced concrete slabs supported by pile bents and were built in 1945 and 1960; they are classified as functionally obsolete and one of them is scour critical. There are also two bridges over the Alafia River: the northbound bridge was constructed in

1952 using continuous steel I-beams. The southbound bridge was built in 1959 using AASHTO Type II beams with the 78' main span beam using post tensioning. Both of these bridges are also classified as functionally obsolete. The CSX railroad crosses the river directly east of the highway bridges on a low level bridge which includes a swing-span bridge in the middle.

Planning Phase/Corridor Analysis – Prior to the beginning of the PD&E study phase, the project was entered into the FDOT's Efficient Transportation Decision Making (ETDM) system. An ETDM *Final Programming Screen Summary Report* was published on April 10, 2013 as ETDM Project number 5180. A separate corridor analysis was not conducted as part of this study since the purpose of this PD&E study was to identify concepts for widening the existing highway (within the existing corridor) consistent with the Hillsborough County MPO's 2040 Long-Range Transportation Plan.

Design Criteria – **Section 6** of this report includes tables showing the proposed roadway design criteria and FDOT's standards for access management.

Traffic Data – Existing annual average daily traffic (AADT) ranges from 23,400 vehicles per day (VPD) to 32,500 VPD; by design year 2040, AADTs are expected to range from 38,800 VPD to 61,000 VPD within the study limits. Two intersections currently operate at level of service (LOS) D during peak hours; by 2040, if no improvements are made, six intersections are expected to operate at LOS E or F. With the recommended intersection improvements, in year 2040, all signalized intersections would operate at LOS D or better if Hillsborough County also widens the county road approaches at these locations. Without the county's participation, the signalized intersections will operate at LOS E or F during at least one peak period.

Alternatives Analysis – For the Build Alternatives evaluation, alternative six-lane suburban typical sections were evaluated for the areas with the existing 182-foot ROW since these can be constructed within the existing ROW. A 30-foot median was recommended instead of a 40-foot median in order to eliminate the need for a design variation for border width. Alternatives were considered that both use and don't use the existing pavement (**Figure 8-1**). The use-existing-pavement alternative was found to be the best from a construction staging standpoint. For the north Gibsonton area where the ROW is much narrower, a six-lane urban typical section is the only practical option; alternative alignments studied included west-shifted, centered, and east-shifted. The estimated ROW costs were summarized in an evaluation matrix (**Table 8-1**), and the recommended alignment is based on a combination of lower ROW costs as well as FDOT's goal to minimize or avoid the need to acquire ROW from CSX Transportation. The resulting recommended alignment in the north Gibsonton area is east-shifted south of Gibsonton Drive, transitioning to a west-shifted alignment between Gibsonton Drive and the Alafia River.

Recommended Build Alternative – The recommended urban typical sections for the north Gibsonton area are shown in **Figure 8-2**, and the recommended suburban typical sections for the other areas are shown in **Figure 8-3**. **Appendix G** includes preliminary conceptual design plans showing the recommended build alternative. Recommended pond sites for stormwater management and floodplain compensation will be determined during the future design phase.

Recommended typical sections for the replacement bridges at Bullfrog Creek and the Alafia River are shown in **Figure 9-4**. These include a 12-foot shared use path on the west side to accommodate the future South Coast Greenway which is being planned by Hillsborough County (**Figures 9-1** and **9-2**). Preliminary estimated project costs are shown below:

Component	Estimated Cost ($millions)
Construction of Roadway, Bridges and Ponds	110
Right of Way for Roadway Only	14
Right of Way for Stormwater Ponds and Floodplain Compensation Sites	17
Wetlands Mitigation	1.0 +/-
Design & Construction Inspection (20%)	$22
Totals	$164

Section 9.19 of this report includes **Table 9-6** which summarizes the recommended changes in median openings and median opening spacing, to better meet the requirements for Access Class 3. Numerous median openings are either proposed to be closed or converted to directional median openings to provide a safer transportation facility. No changes in the access management classification are proposed. A public hearing is planned to be held later in the PD&E study process.

SECTION 1 SUMMARY OF PROJECT

1.1 SUMMARY STATEMENT

This *Draft Preliminary Engineering Report* contains detailed engineering information that fulfills the purpose and need for the proposed widening of US 41 (SR 45) between Kracker Avenue and SR 676 (Causeway Boulevard) in Hillsborough County Florida (**Figure 1-1**).

1.2 COMMITMENTS AND RECOMMENDATIONS

To be included in the final edition of this report, following the public hearing.

1.3 DESCRIPTION OF PROPOSED ACTION

The proposed Florida Department of Transportation (FDOT) project involves the widening of US 41 (SR 45) from Kracker Avenue (milepoint 15.784) to south of SR 676 (Causeway Boulevard - milepoint 22.791), in Hillsborough County. The study limits length is approximately 7.0 miles. US 41 is already six lanes to the north of the current study limits. The highway is proposed to be widened/reconstructed from an existing, four-lane divided rural and urban facility to a six-lane divided facility, with suburban typical sections in the areas with the existing 182-foot right of way (ROW) and an urban typical section in the north Gibsonton area where the ROW is much narrower. In addition, the bridges over Bullfrog Creek and the Alafia River are proposed to be replaced and include space for the future South Coast Greenway, which will run parallel to US 41 in several areas. The proposed improvements will include construction of stormwater management facilities and floodplain compensation sites and improvements at major intersections, in addition to inclusion of multimodal facilities (trail, pedestrian, bicycle and transit accommodations).

SECTION 2 INTRODUCTION

2.1 PROJECT DEVELOPMENT AND ENVIRONMENT STUDY PROCESS

The objective of the Project Development and Environment (PD&E) study is to help the FDOT and any federal agencies reach a decision on the type, location, and conceptual design of the necessary improvements to US 41 to safely and efficiently accommodate future travel demand. Factors considered include transportation needs, socioeconomic and environmental impacts, engineering requirements and cost estimates. In general terms, the process involves the following steps:

1. Verifying the project purpose and need developed during the ETDM screening process
2. the gathering and analysis of detailed information regarding the natural and cultural features of the study area in addition to engineering data
3. the development and evaluation of alternatives for meeting the project need
4. the selection of a Preferred Alternative, and
5. documenting the entire process in a series of reports

During the process, communication with the affected public is accomplished directly, through small-group meetings and a public hearing, and indirectly, through interaction with elected officials and agency representatives. The PD&E study process is designed to satisfy all applicable state and federal requirements, including (for federal documents) the National Environmental Policy Act (NEPA), in order for this project to qualify for federal-aid funding of subsequent project phases (design, right of way acquisition and construction) or to simply advance to subsequent phases in the case of a *State Environmental Impact Report* (SEIR). In addition to the Build Alternative, the No-Build Alternative is also considered as part of the study process.

2.2 PROJECT HISTORY AND BACKGROUND

Prior to the beginning of the PD&E study phase, the project was entered into the FDOT's Efficient Transportation Decision Making (ETDM) system. An ETDM *Final Programming Screen Summary Report* was published on April 10, 2013 as ETDM Project number 5180. A SEIR is being prepared as part of this study.

2.3 PURPOSE OF REPORT

The purpose of this report is to document all of the engineering-related aspects associated with the proposed widening of US 41. Separate reports are being prepared to document environmental effects and public involvement efforts (see **Section 10** for list).

SECTION 3 PURPOSE AND NEED FOR PROJECT

US 41 within the study area plays a significant role in connecting southern Hillsborough County to the Tampa Bay region. The purpose of the proposed project is to accommodate future traffic demands on US 41 due to growth within the project limits and surrounding areas. This corridor is projected to operate at level of service (LOS) F in the design year (2040) if no increase in capacity is provided. Factors which support the need for the project include:

Regional Connectivity - US 41 is a major north-south regional arterial that parallels I-75 and US 301 and connects south Hillsborough County to the Tampa Bay region. It provides connectivity between the communities of Apollo Beach, Riverview, and Gibsonton. US 41 is a "regional road" according to the West Central Florida Metropolitan Planning Organization's (MPO's) Chairs Coordinating Committee (CCC). US 41 also provides highway access to the Port of Tampa facilities at Pendola Point and Port Sutton.

Safety - With the additional capacity provided in the corridor by the widening of US 41 from four to six lanes, roadway congestion will be reduced, which will decrease potential conflicts with other vehicles and potentially increase safety. An analysis of traffic crash data for years 2008 thru 2012 revealed that the overall average crash rate within the study limits was lower than the statewide average crash rate for similar type facilities. While not structurally deficient, the bridges over both Bullfrog Creek and the Alafia River are classified as functionally obsolete due to substandard-width shoulders. In addition, the sidewalks on the bridges are very narrow and there are no provisions for bicyclists on the bridges.

Plan Consistency - This project is consistent with the Comprehensive Plan for Unincorporated Hillsborough County. The Hillsborough County *Imagine 2040 Long-Range Transportation Plan (LRTP)* indicates a need to widen US 41 to 6-lanes from 19th Avenue to north of Madison Avenue, "beyond 2040". In addition, a short segment between Madison Avenue and Causeway Boulevard is shown as 6 lanes in the Cost Feasible FDOT Strategic Intermodal System Projects, with design after year 2026.

Hillsborough County has designated US 41 between Madison Avenue and Palm River as a Constrained Road, as shown in **Figure 3-1**.

Emergency Evacuation - US 41 is listed as an evacuation route by the Hillsborough County Emergency Management and shown on the Florida Division of Emergency Management's evacuation route network. US 41 provides access to I-75 via interchanges with east-west connections on Gibsonton Drive, Big Bend Road (CR 672) and SR 60 in close proximity to the study limits.

US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Constrained Roads Within the Study Area**	**Figure 3-1**

Current and Future Transportation Demand - Traffic in the corridor is expected to increase due to projected population and employment growth along the corridor. In 2013, the Annual Average Daily Traffic (AADT) ranged between 23,400 vehicles per day (VPD) (Level of Service [LOS] B) and 36,400 VPD (LOS B) within the study area according to the *Design Traffic Technical Memorandum*. With a maximum AADT of 32,350 VPD over the four lane section, US 41 is at 88 percent capacity for the adopted level of service standard of D. The current Tampa Bay Regional Planning Model (TBRPM) – Version 7.1 indicates that the AADTs in 2035 are expected to range between approximately 46,100 VPD and 72,750 VPD. The existing four lane cross section would result in a LOS F with the future projected traffic volume. The widening of this facility is also intended to provide relief to parallel facilities such as I-75 and US 301.

Modal Interrelationships – Expansion of the existing roadway would help improve mobility for the Hillsborough Area Regional Transit (HART) Authority local bus route 31 within the corridor. Bicycle and pedestrian accommodations will also be considered as part of the proposed improvements.

US 41 is part of the highway network that provides access to regional intermodal facilities such as the Port of Tampa and Port Manatee. The segment of US 41 between Madison Avenue/Pendola Point Road and SR 676 is designated as a *Strategic Intermodal System* (SIS) connector. The SIS is a statewide network of highways, railways, waterways, and transportation hubs that handle the bulk of Florida's passenger and freight traffic. Improvements to US 41 would enhance access to activity centers in the area and would improve movement for goods and freight in the Tampa Bay region and across the State.

SECTION 4 EXISTING CONDITIONS

4.1 EXISTING ROADWAY CHARACTERISTICS

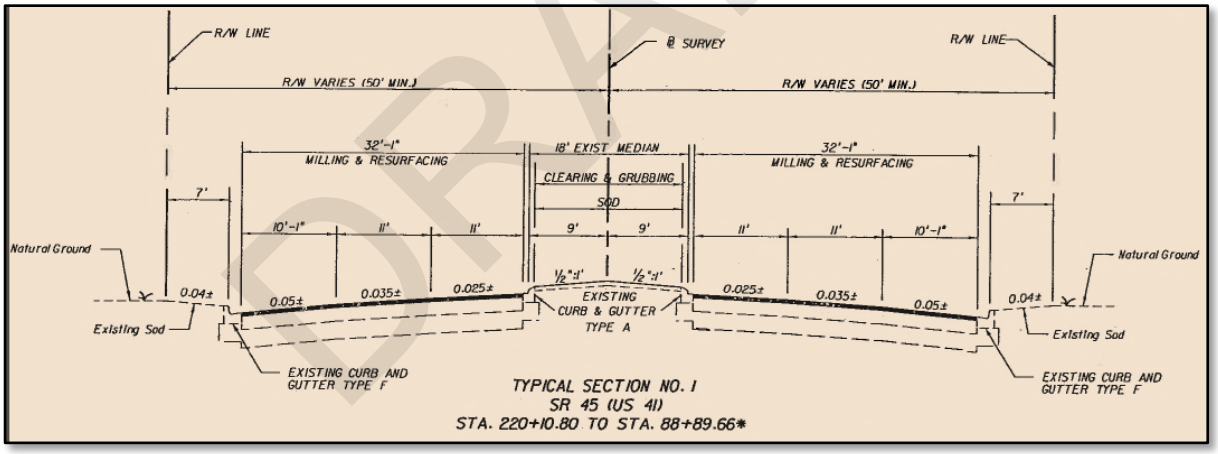
4.1.1 Roadway Classification and Access Management

The existing highway is functionally classified as an "urban principal arterial – other" within the study limits. The existing access management classification is mostly Class 3, which requires minimum 1/2 mile spacing for full median openings and traffic signals and 1/4 mile spacing for directional median openings. US 41 is Access Management Class 7 north of Port Sutton Road. There are several areas which currently do not meet the minimum spacing standards for full median openings – these are primarily in the north Gibsonton area, where the average full median opening spacing is as close as 1/10 mile. FDOT's standards for access management are included in **Section 6.**

4.1.2 Typical Sections and Posted/Design Speeds

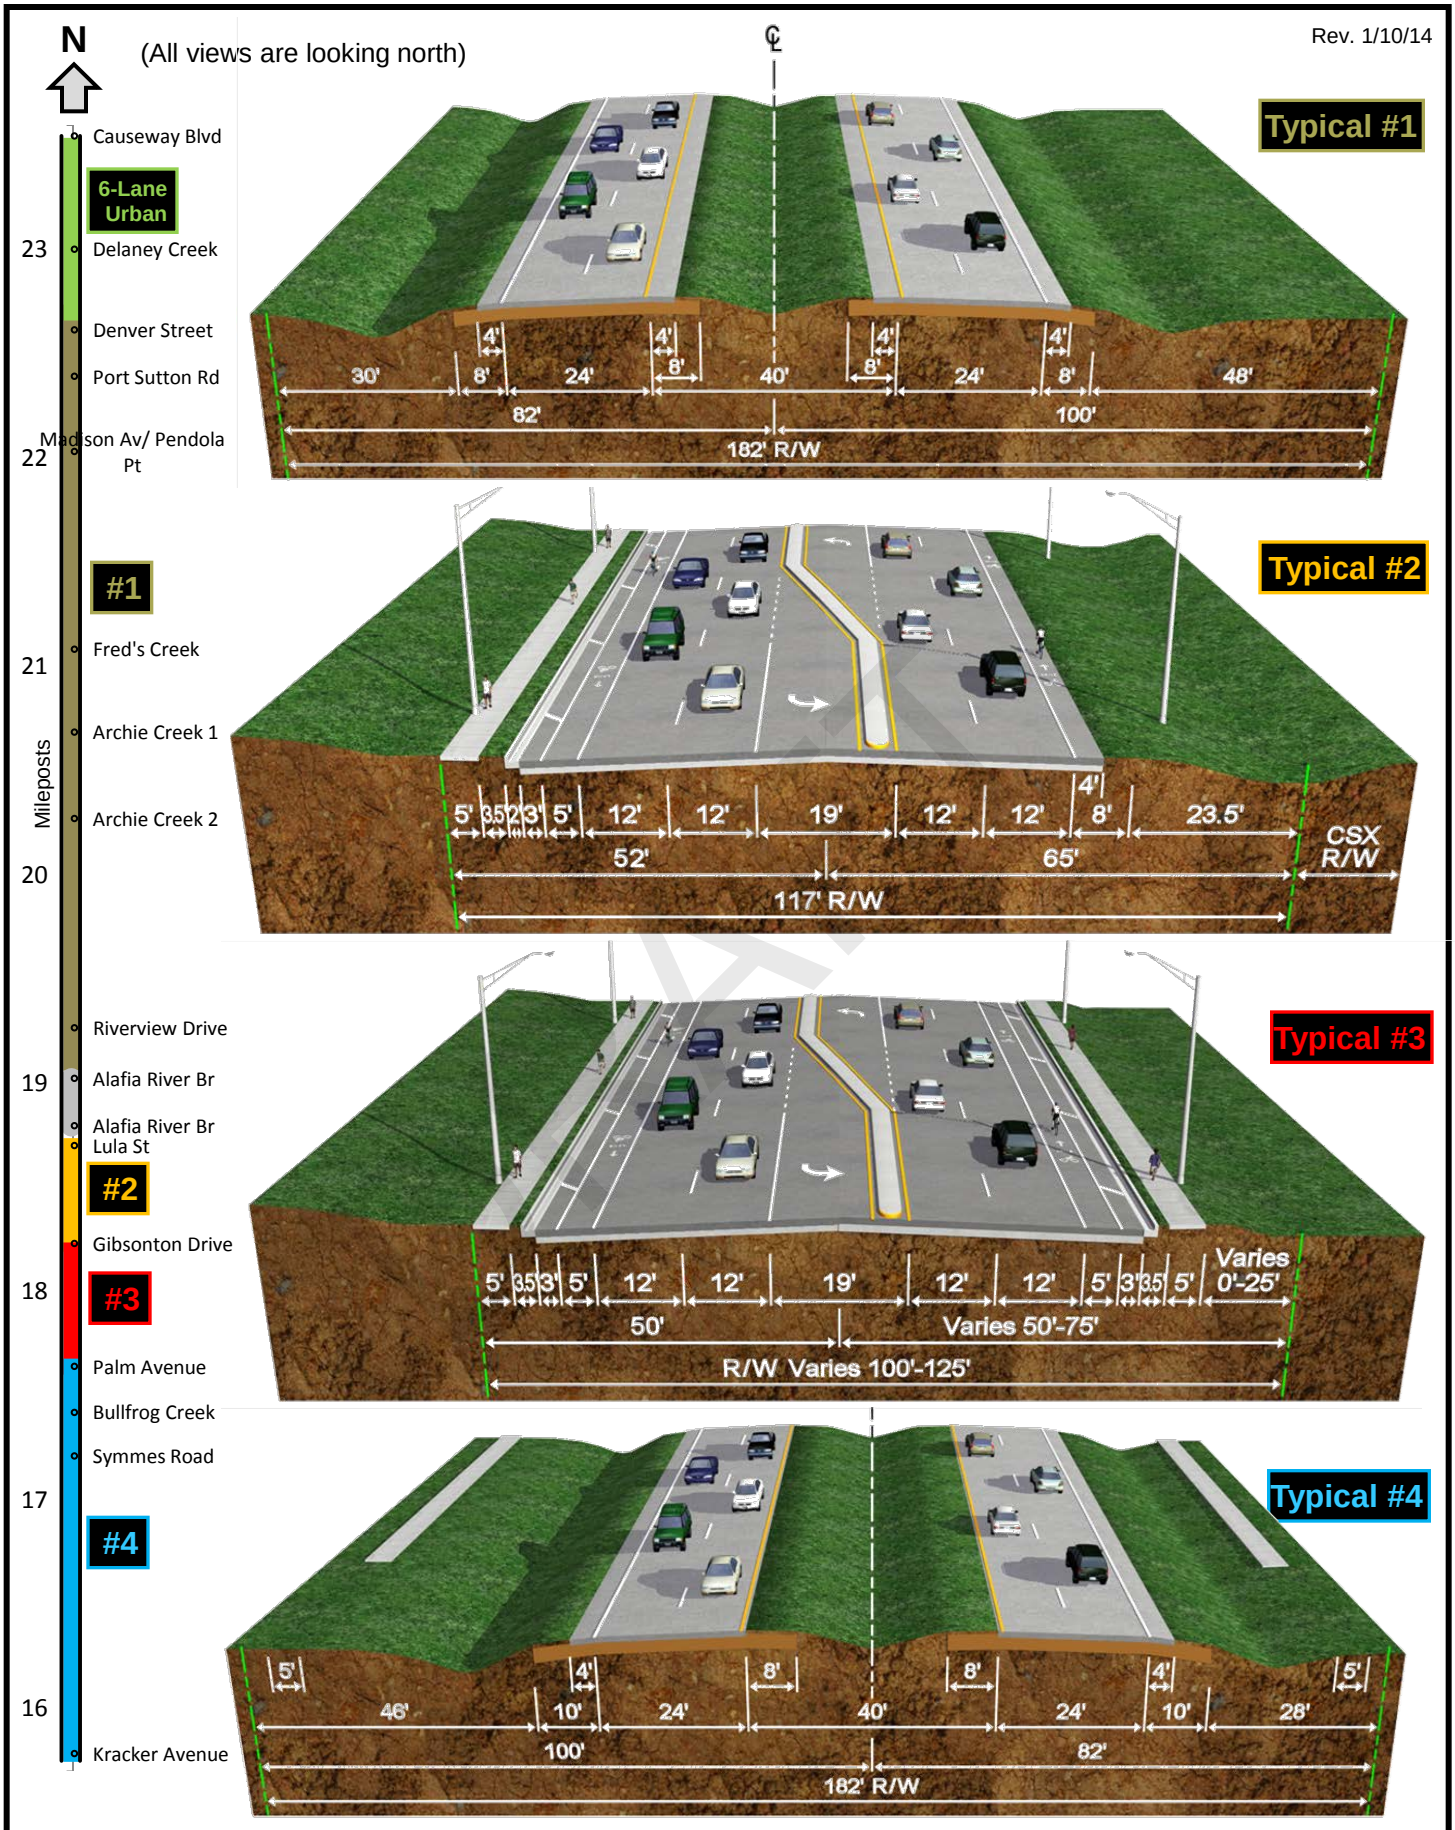
US 41 currently has both four-lane divided rural and urban typical sections. In addition, a 0.9-mile segment between Denver Street and Causeway Boulevard has already been widened to a six-lane urban section highway. The existing six-lane typical section is shown below in **Figure 4-1**.

Figure 4-1 Existing Six-Lane Typical Section North of Denver Street



Note that the existing outside lane widths in the six-lane segment are only 10-feet 1-inch wide according to the resurfacing as-built plans. In addition, the border widths are substandard in width, and there are no sidewalks or bicycle facilities in this segment.

The existing four-lane roadway typical sections are illustrated in **Figure 4-2**. Areas outside of the north Gibsonton area have four-lane rural typical sections with 40-foot medians which are asymmetrical within the existing 182-foot right of way (ROW). The north end (Typical number 1) has paved inside and outside shoulders while the south end only has paved outside shoulders; otherwise they are nearly identical.



FDOT **US 41(SR 45) PD&E Study** *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Existing Roadway Typical Sections**	**Figure 4-2**

Two different typical sections are representative within the north Gibsonton area. The section south of Gibsonton Drive is essentially symmetrical (except for the east-side ROW) and features a 19-foot median, 12-foot lanes and sidewalks and 5-foot bicycle lanes. The typical section north of Gibsonton Drive is similar except that a CSX railroad track runs parallel and adjacent to the ROW on the east side, resulting in an urban section on the west side and a rural-type typical section on the east side, with a drainage ditch shared between the roadway and the railroad. The bicycle lanes on either side vary slightly in width, and there is no sidewalk on the east side, next to the railroad.

The posted speed limit is 55 miles per hour (mph) south of Symmes Road and north of Riverview Drive and 50 mph between these two locations, in the north Gibsonton area, as shown in **Figure 4-3**. According to the as-built plans, the original design speeds were 55 to 60 mph in the rural typical section areas and 50 mph in the urban typical section area (north Gibsonton area).

4.1.3 Pedestrian and Bicycle Facilities

Sidewalks along US 41 currently begin south of Ohio Street and continue northward into north Gibsonton, on both sides south of Gibsonton Drive and on the west side only north of Gibsonton Drive, ending at Lula Street (near the south approach to the Alafia River bridges). In addition, the rural typical section areas include 4-foot paved shoulders which are designated as bicycle lanes, and the urban typical section area (in north Gibsonton) includes bicycle lanes which vary from 4 to 5 feet wide, as shown in the existing typical sections figure referenced above. Sidewalks on the Bullfrog Creek bridges vary in width from 3.6 feet to 4 feet, and sidewalks on the Alafia River bridges vary from 3.3 to 3.4 feet. None of the bridges have bicycle lanes, and the outside shoulder widths vary from approximately 1 to 2 feet at Bullfrog Creek and are 2 feet on the Alafia River bridges.

In addition, the following signalized intersections along US 41 include crosswalks and pedestrian pushbuttons and signal indications:

- At Symmes Road
- At Palm Avenue (shopping center entrance on east side)
- At Gibsonton Drive
- At Madison Avenue
- At Port Sutton Road

There are no pedestrian features at the signalized intersection of US 41 at Riverview Drive.

4.1.4 Right of Way

The ROW width varies from 100 to 117 feet in the north Gibsonton area to typically 182 feet in the rural typical section areas to the south and north. The existing ROW width is graphically illustrated in **Figure 4-4**. As shown on the existing typical sections figure, the highway is not centered within the existing ROW in most areas. At the south end the centerline of construction is offset by 9 feet to the right while the centerline is offset 9 feet to the left for the northern section.

4.1.5 Horizontal Alignment

The existing horizontal alignment was obtained from a combination of as-built plans and FDOT's straight line diagram (SLD) inventory. **Table 4-1** summarizes the existing horizontal alignment. There are nine horizontal curves within the study limits ranging from a 0 degree – 3 minute curve to a 4 degree curve located south of Bloomingdale Avenue. All of these curves meet current FDOT Plans Preparation Manual requirements for the design speeds shown in the table; however, the superelevation of the curve south of Bloomindale Avenue should be at least 8.3 percent instead of the existing 3 percent to meet current design standards.

4.1.6 Vertical Alignment

The roadway construction and 3R as-built plans were reviewed for existing vertical geometry; however, minimal vertical profile data was found in these plans. The roadway overall is very flat and low due to its location directly east of Tampa Bay. Elevations are estimated to range from about 5 feet to 10 feet throughout the project limits, except at the Alafia River bridges. Within the north Gibsonton area, ground elevations range from about 8 to 10 feet NGVD29, based on old as-built plans.

The existing roadway and bridge profiles at the Alafia River bridges were field surveyed in July 2014 due to conflicting information shown on the bridge and roadway as-built plans. The existing profile information for that location is summarized in **Table 4-2** and **Figures 4-5** and **4-6**. The existing vertical curves at these bridges appear to meet current design standards based on the estimated roadway design speeds, as shown in the table.

Table 4-1 Summary of Existing Horizontal Curves

4.1.7 Drainage and Floodplains

The study limits of the US 41 corridor fall within the Alafia River watershed. The proposed drainage areas are divided into 11 sub-basins which ultimately discharge to Tampa Bay. The basin limits are illustrated in **Figure 4-7.** The 11 sub-basins were further subdivided into 14 project basins (**Table 4-3**).

		Total	**159.21**	

In the rural typical section areas, drainage is provided by a system of swales and ditches. Within the urban typical section area (north Gibsonton), stormwater runoff from US 41 is collected by an underground system of inlets and pipes, as described below.

Drainage for the north Gibsonton area (defined for this section as the area between Bullfrog Creek and the Alafia River) is provided by three different inlet and pipe systems, as shown in **Figure 4-8**. Beginning at Bullfrog Creek, a pipe and inlet system extends from Bullfrog Creek to approximately Shirley Avenue, with curb and gutter comprising the northern portion, north of Cedar Avenue. The northern portion of this system has a 30-inch pipe with catch basin inlets which connects to a 36-inch pipe near Cedar Avenue and continues to the south, with ditch-bottom and other storm drain inlets. The 36-inch pipe outfalls at Bullfrog Creek on the west side of US 41.

The second pipe and inlet system runs from about Lewis Avenue to Marilla Avenue, with an outfall to a transverse drainage ditch located on the west side of US 41 less than 400 feet south of Gibsonton Drive. This system is mostly served by an 18-inch trunk line. The outfall ditch is contained within a 50-foot easement which connects it to Hillsborough Bay.

Drainage Map of the North Gibsonton Area - Figure 4-8

The third pipe and inlet system runs from south of Anna Avenue (located about 900 feet north of Gibsonton Drive) to just south of the Alafia River. The east side of US 41 between Gibsonton Drive and the Alafia River is drained by a ditch which is shared with the CSX Railroad; this ditch outfalls to the Alafia River next to the rail line which crosses the River. The west side of the road is drained by an enclosed drainage system with 18-inch to 24-inch pipes which outfall to a small "inlet" of the River on the west side of US 41, on property owned by Mosaic.

Floodplains

There are a total of 12 cross drains and 6 bridge pair/bridge culverts within the study limits. **Table 4-4** summarizes data for the existing cross drains and bridge culverts. Information on the existing bridges is included in **Section 4.2**. **Figure 4-9** shows the existing 100-year floodplain in addition to cross drain and bridge culvert locations. The condition of the bridge culverts is discussed in **Section 4.2.**

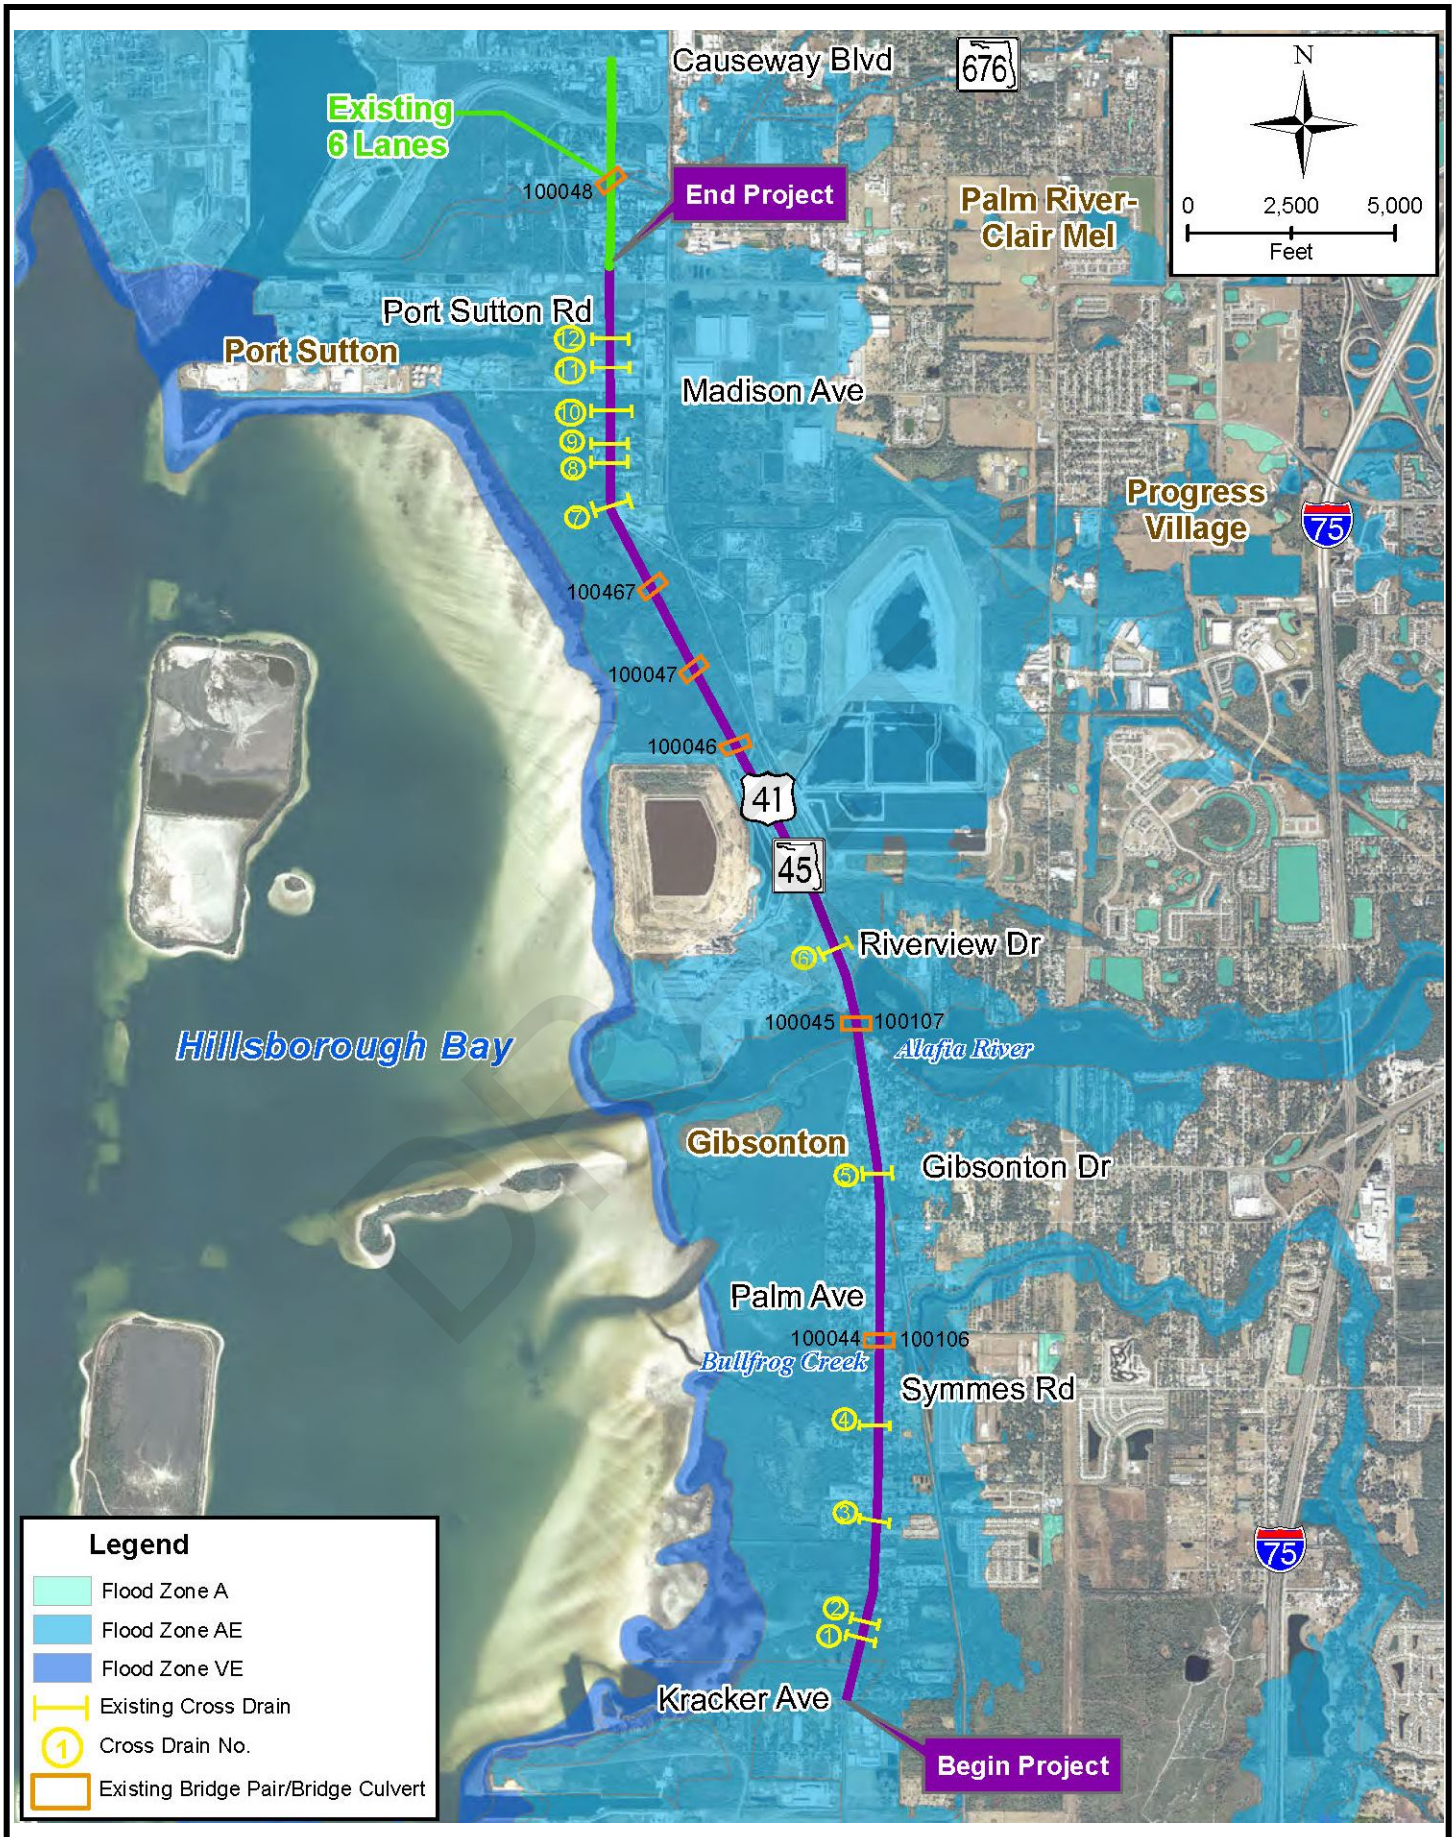
The Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs) dated August 28, 2008: 12057C0484H, 12057C0482H, 12057C0369H and 12057C0367H indicate that the study limits are within Flood Zone AE (El 11.0 feet) from approximately Station 831+00 to Station 840+00 and Zone AE (10.0 feet) for the remainder of the study limits. FEMA Maps are included in Appendix A of the *Location Hydraulics Memorandum*. Per direction from the Southwest Florida Water Management District (SWFWMD), the FEMA elevations are based on storm surge conditions and base floodplain impacts should be assessed based on the lower riverine floodplain elevations.



US 41(SR 45) PD&E Study
From Kracker Avenue to South of SR 676 (Causeway Blvd)
WPI Segment No. 430056 1 - Hillsborough County

Floodplain and Drainage Structure Locations

Figure 4-9

Hillsborough County provided GIS data and the following studies that establish the base floodplain for the project limits:

- Bullfrog Creek/ Wolf Branch Watershed Management Plan, dated October 2000
- Countywide Master Plan Update for the Alafia River Watershed, dated November 2010
- Delany Creek Area Stormwater Master Plan Update, dated April 2007

Floodplain elevations for each project basin are identified in **Table 4-5**. Bullfrog Creek elevations are provided in NGVD 29; however, these elevations were converted to NAVD 88 based on a conversion factor of -0.9.

The project limits have been evaluated to determine potential impacts to the base floodplain. **Table 4-5** identifies estimated floodplain elevations. Cup for cup compensation will be provided for any fill placed within the floodplain. Approximate required floodplain compensation site area requirements are presented in **Section 9.16**.

①*The estimated 100-year elevations are taken from Bullfrog Creek/Wolf Branch Watershed Management Plan, Countywide Masterplan Update for the Alafia River Watershed, and the Delany Creek Area Stormwater Master Plan Update.*

Based on the evaluation of anticipated improvements, the applicable floodplain statement according to the FDOT PD&E Manual Part 2 Chapter 24 is Statement 4- PROJECTS ON EXISTING ALIGNMENT INVOLVING REPLACEMENT OF EXISTING DRAINAGE STRUCTURES WITH NO RECORD OF DRAINAGE PROBLEMS:

"The proposed drainage structures will perform hydraulically in a manner equal to or greater than the existing structures, and backwater surface elevations are not expected to increase. As a result, there will be no significant adverse impacts on natural and beneficial floodplain values. There will be no significant change in flood risk, and there will not be a significant change in the potential for interruption or termination of emergency service or emergency evacuation routes. Therefore, it has been determined that this encroachment is not significant.

The project's drainage design will be consistent with local FEMA, FDOT, and Southwest Florida Water Management District (SWFWMD) design guidelines, which state that no net encroachment up to that, encompassed by the 100-year event, will be allowed, and that compensating storage shall be equivalently provided. Therefore, no significant changes in base flood elevations or limits will occur.

The FEMA FIRMs identify designated floodways associated with the Bullfrog Creek, Alafia River, and Delany Creek water bodies. During the design phase for this proposed project, Bridge Hydraulics Reports will be prepared for each bridge and a No-Rise certification will be performed for modifications to bridges associated with each regulated floodway.

4.1.8 Geotechnical Data

Based on a review of the U.S. Department of Agriculture (USDA) and the Natural Resources Conservation Service (NRCS) Soil Survey for Hillsborough County, Florida, the predominant soils within the study limits consist of Myakka fine sand, Malabar fine sand, Pinellas fine sand, and St. Johns fine sand. For the purpose of estimating the SCS runoff Curve Numbers, the Hydrologic Soil Group was retrieved from the South West Florida Water Management District (SWFWMD) Information System website. See **Table 4-6** for USDA soils and **Figures 4-10** and **4-11** for a soils map.

Table 4-6 Existing Soils in the Study Area

Map #	Soil Name	Hydrologic Group	Depth to High Water Table (ft)	Soil Type	Description
5	Basinger Fine Sand, Holopaw Sand, Samsula muck	D	+2-1.0	Sandy and loamy soil	Very poorly drained soil in depressions, slopes 0-2%

4.1.9 Crash Data and Safety Analysis

Crash data along US 41 within the project limits was obtained from the Florida Department of Transportation (FDOT) for the most recent 5-year (2008 through 2012) period. There were a total of 551 crashes reported within the project limits during the 5-year period which involved 408 injuries and 7 fatalities. **Table 4-7** below summarizes the 5-year crash history along the study corridor. As a part of the analysis, the number of crashes that occurred under wet conditions and the number of crashes that occurred at night were also summarized.

Table 4-7 Summary of Crash Analysis along US 41

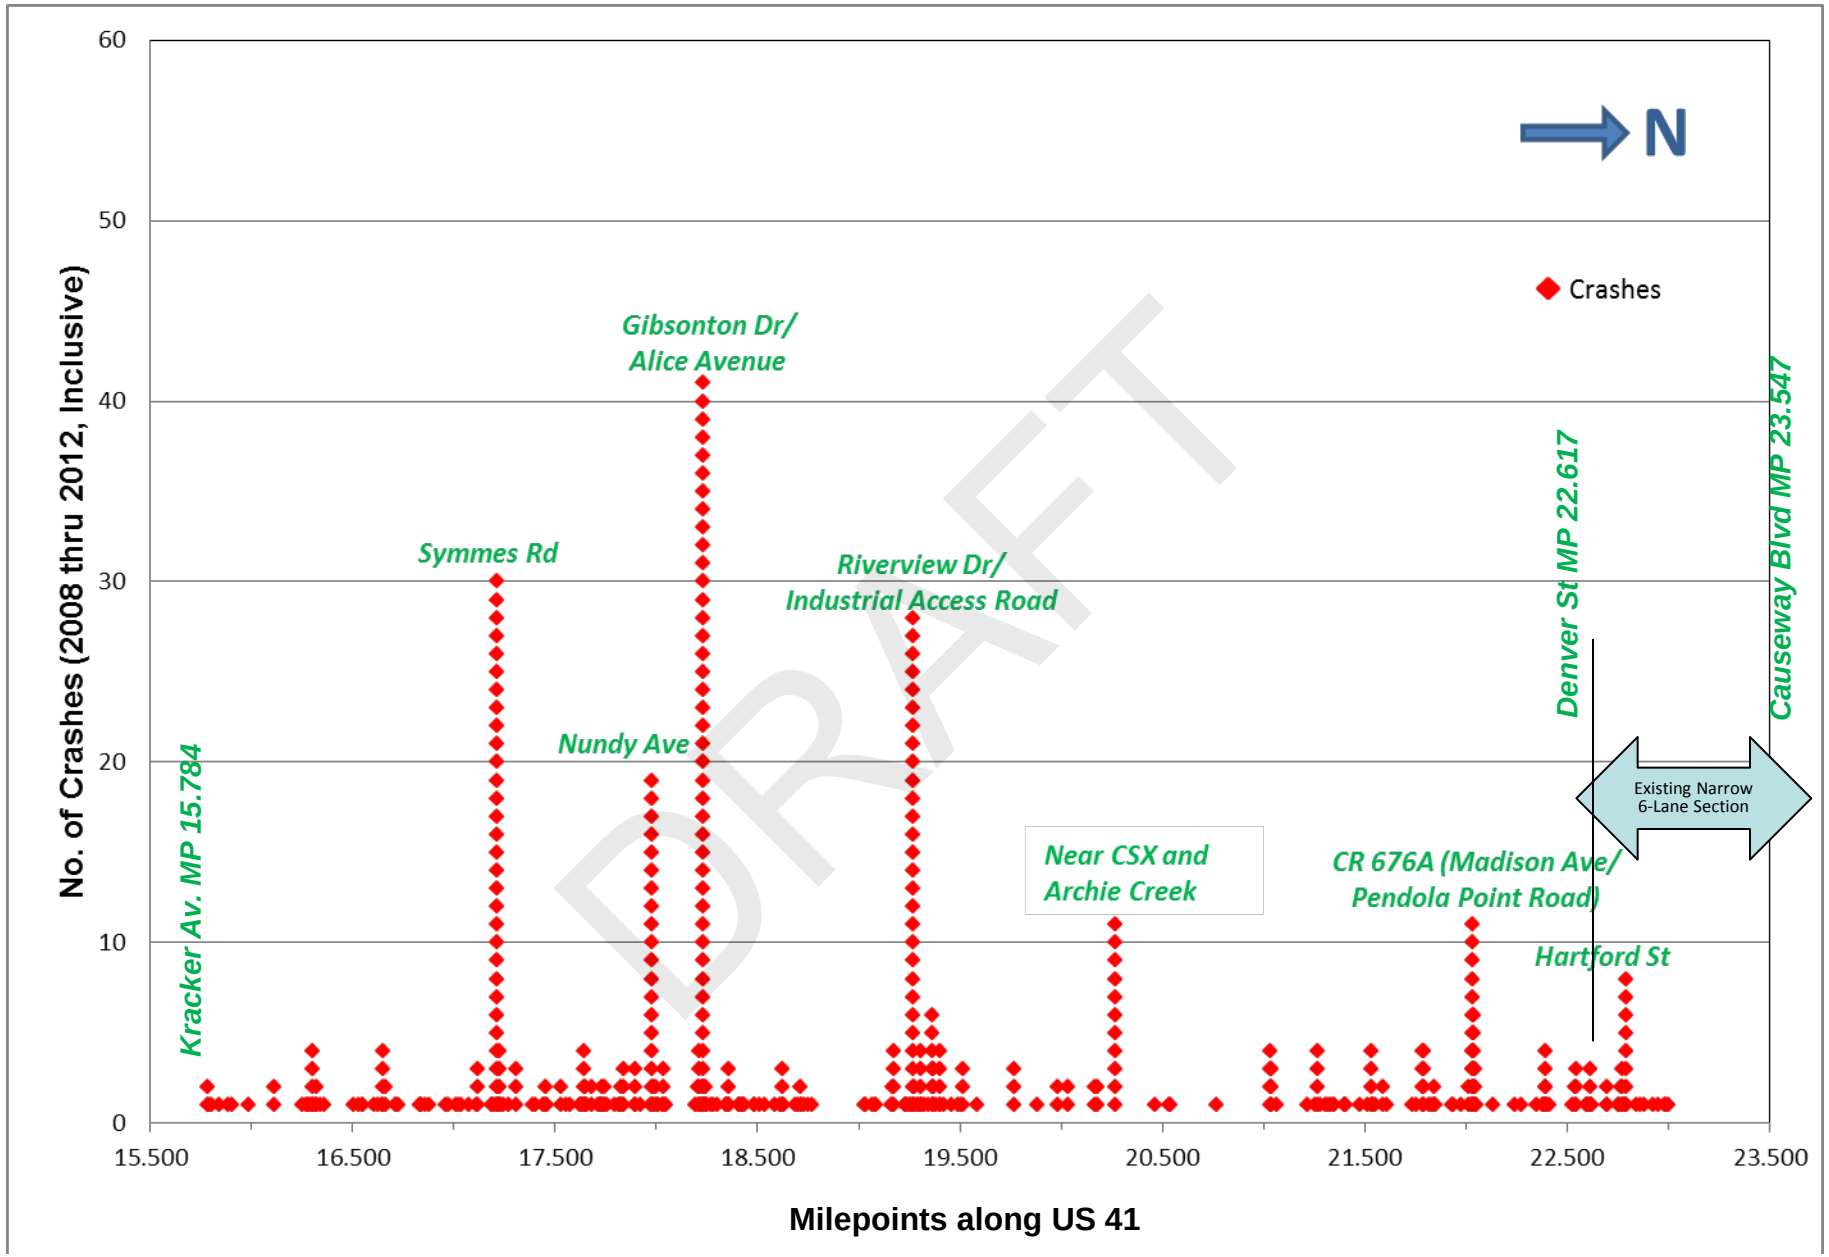
US 41 from Kracker Avenue (MP 15.784) to south of Causeway Boulevard (MP 23.003) in Hillsborough County	Year					Five Year Total
	2008	2009	2010	2011	2012	
No. of Fatal Crashes	3	1	0	0	3	7
No. of Injury Crashes	46	43	55	58	50	252
No. of Property Damage Only Crashes	72	58	59	45	58	292
Total Crashes	**121**	**102**	**114**	**103**	**111**	**551**
Wet weather crashes	1	1	1	4	5	12
Night-time crashes	43	36	33	44	42	198
Average Crash Rate with Average AADT of 27,250						*1.54*
*Statewide 5-Year Average Crash Rate for Urban Segments**						*2.39*

**Obtained from FDOT – District Seven*

The table above shows that the average crash rate over the study corridor of US 41 is 1.54 which is lower compared to the statewide 5-year average crash rate for 4-5 lanes two-way divided raised urban segments of 2.39.

The distribution of the crashes by milepoint is shown in **Figure 4-12**. The plot indicates that the majority of the crashes occurred at the intersections of Symmes Road, Nundy Avenue, Gibsonton Drive/Alice Avenue, Riverview Drive/Industrial Access Road, CR 676A (Madison Avenue/Pendola Point Road) and Hartford Street.

The breakdown of the total crashes within the study limits for the last available five years along US 41 by crash type were also determined and is shown in **Table 4-8** and **Figure 4-13**. Overall rear-end crashes accounted for 39 percent of the total crashes, angle crashes accounted for 20 percent, each of sideswipe crashes and left-turn crashes accounted for 3 percent and the remaining 35 percent of the crashes were the other crash types, mostly single-vehicle run-off-the-road , along with head-on and bike and ped crashes.



US 41(SR 45) PD&E Study
From Kracker Avenue to South of SR 676 (Causeway Blvd)

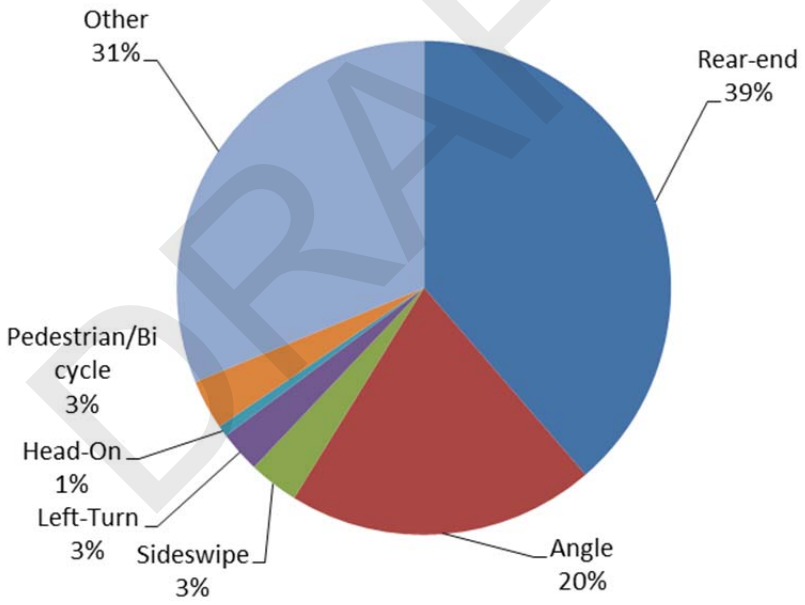

Figure 4-13 Crashes Types along US 41 from Kracker Avenue to South of SR 676

Sixteen (16) of the 18 pedestrian/bicycle crashes occurred along US 41 between Kracker Avenue and Gibsonton Drive. Of the 18 pedestrian/bicycle crashes, 15 involved injuries and 3 involved fatalities.

Since nighttime crashes accounted for approximately 36 percent of the overall crashes and only limited segments currently are lighted, the department is currently planning to add lighting between Denver Street and Riverview Drive as part of a 3R job, and the segment between Big Bend Road and Symmes Road is being studied for the potential need to add lighting.

4.1.10 Intersections and Signalization

Existing signalized intersection locations and major unsignalized intersection locations along with the existing intersection lane geometry are shown in **Figure 4-14.** There are presently six (6) signalized intersections within the study limits excluding the intersection at Causeway Boulevard.

4.1.11 Lighting

The existing roadway has street lighting between Symmes Road and Riverview Drive. The luminaires are mounted on aluminum poles with both same-side and staggered spacing in different areas. The lights are maintained by Tampa Electric Company (TECO).

4.1.12 Utilities, ITS and Railroads

There are numerous utilities throughout the study corridor, as shown in **Table 4-9**, based on the *Utility Assessment Package* prepared in February 2015. The study area includes a 4-inch ammonia pipeline that runs the entire length of the project on the west side of US 41; at the Alafia River, it reportedly runs about 40 feet beneath the river. In addition, Florida Gas Transmission (FGT) has a 6.625-inch gas line that crosses US 41 at the Riverview Drive intersection, as shown in **Figure 4-15**. The exact location and depth of the pipeline is unknown; further coordination with FGT will occur during future project phases.

Table 4-9 Existing Utilities in the Study Area

Utility Owner	Type of Facilities
Bright House Networks	Cable TV (mostly overhead lines)
Mosaic Fertilizer	20”-24” Water lines near Riverview Drive
Central FL Pipeline-Kinder Morgan	16” LP pipeline crosses at south side of Madison
Florida Gas Transmission	6.6” Gas Pipeline crosses at Riverview Drive
Verizon Florida	Cable/Fiber/Phone – both overhead and buried
Hillsborough County Traffic Services	Communications Cable, signals, conduit, etc.
Hillsborough County Water	Water & sewer; asbestos concrete pipe
Level 3 Communications	Fiber Optic on east side of roadway
TECO Peoples Gas	Gas lines north of Old US 41
TECO Peoples Gas Transmission	Natural Gas Lines
City of Tampa Water	Water lines north of Old US 41, various sizes
Tampa Bay Pipeline Corp.	Two 4” Ammonia Pipelines on west side of 41
Tampa Electric Company	13.2 kv power lines entire project length
TECO Fiber	Aerial FO entire length of project

WPI Segment No. 430056 1 - Hillsborough County

Florida Gas Transmission Facilities at Riverview Drive

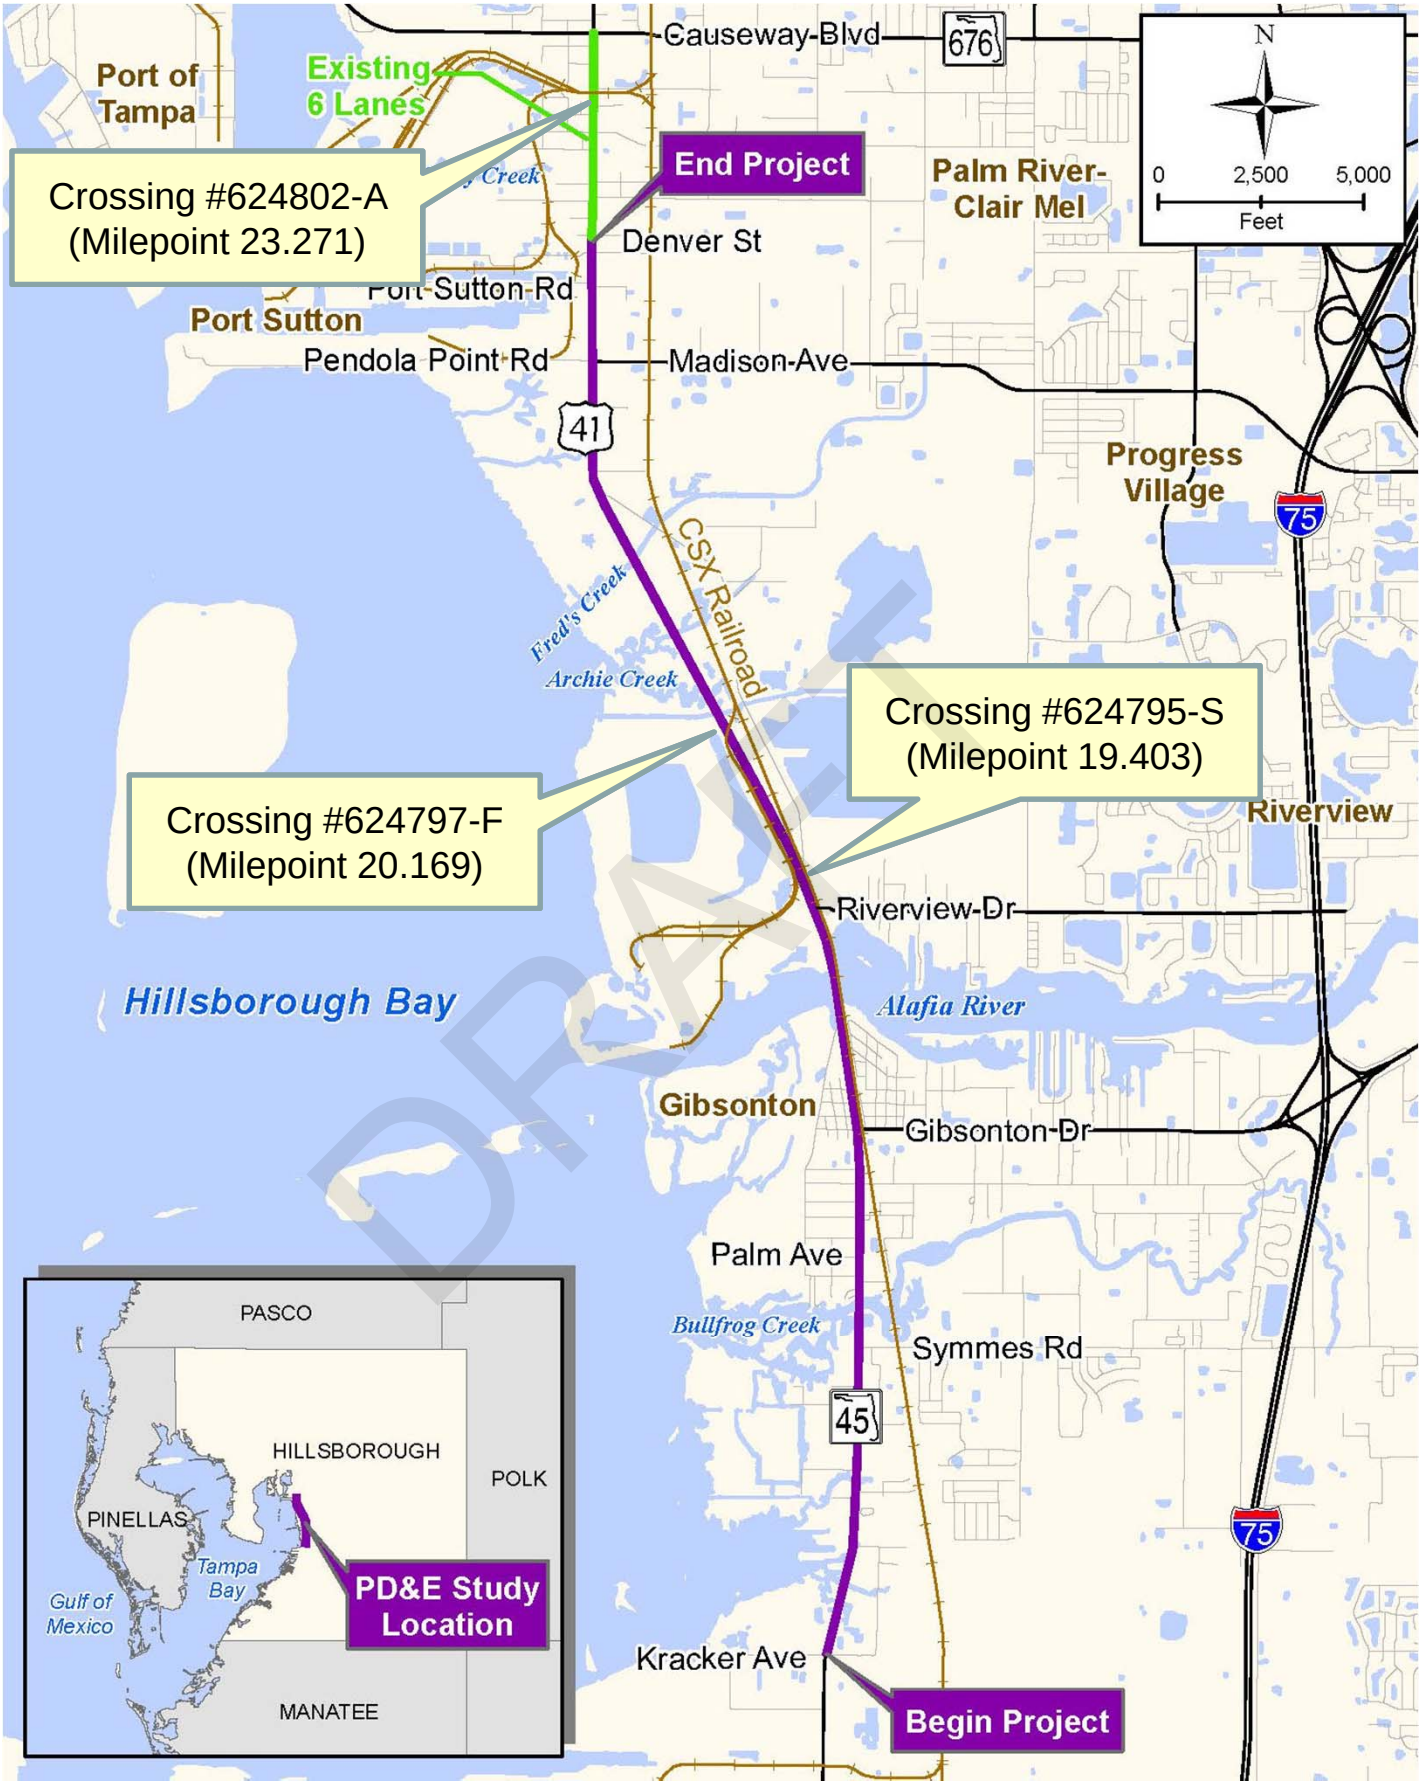
Figure 4-15

With respect to railroads, the CSX Transportation (CSXT) Tampa Terminal Subdivision and Palmetto Subdivision line runs east of and parallel to US 41 for the entire project limits. It is directly adjacent to US 41 from Gibsonton Drive to approximately River Drive. Based on a train count made on 5/1/2012 provided by the District Rail Coordinator, this railroad line has 4 daytime switching trains and 3 nighttime switching trains per day, for a total of 7 trains per day. These freight trains range from 35 to 40 miles per hour, with a maximum time table speed of 40 miles per hour.

There are three rail spur crossings on US 41 at the following locations (from north to south), as shown in **Figure 4-16**. One is located south of SR 676 (Causeway Boulevard) (624802-A CSX), the second is located south of Madison Avenue (624797-F CSX) and the third one is located north of Riverview Drive (624795-S CSX).

The following information was received from the District's Rail Section on these railroad crossings:

- 624802-A (Milepoint 23.271) - There are 22 train movements during a day on this track. The Rail Office completed a Feasibility Study in 2007 that considered relocating the crossing 500 feet further south so that a grade separation could be installed over the relocated rail.
- 624797-F (Milepoint 20.169) - There is no accurate information for this track. The future plan is to install a new crossing surface for this track. FDOT estimated about 8 movements a day with 5 to 10 minutes for each movement.
- 624795-S (Milepoint 19.403) - There are no train movements on this track. This is used only as an emergency exit if there is a problem at/on the crossing to the north (624797). The Rail Office has requested to eliminate the crossing (remove track from roadway).



US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**CSXT Railroad Crossing Locations**	**Figure 4-16**

4.1.13 Pavement Conditions

A flexible pavement condition survey was conducted by FDOT in 2014 for the project corridor. Each section of pavement was rated for cracking ride, and rutting on a 0-10 scale with 0 the worst and 10 the best. Any rating of 6.0 or less is considered deficient pavement and is marked with an asterisk. **Table 4-10** identifies the existing and projected pavement condition ratings for US 41. The existing pavement is generally in good condition.

Table 4-10 Pavement Condition Survey Results

Beginning Milepoint	Ending Milepoint	Side	Condition Category	Year 2014 Ratings	Year 2019 (Projected)	Year Finished Paving

4.2 EXISTING STRUCTURES

There are a total of eight bridge structures along US 41 within the limits of this project; of the eight structures, four are bridge culverts.

4.2.1 Bridge Culverts

Features of the existing bridge culverts are summarized in **Table 4-11**. The first two box culverts convey flow from Archie Creek. The first box (Bridge No. 100046) at milepoint (MP) 20.271 consists of a double 10'x6' barrel structure while the second box (Bridge No. 100047) utilizes a triple 10'x6 barrel structure at MP 20.686. A double 10'x6' barrel bridge culvert (Bridge No. 100467) at MP 21.084 is used to carry US 41 traffic over Fred's Creek. All of these bridge culverts were originally

constructed in 1943 and were later extended in 1959. The culverts at Archie Creek were last inspected on March 21, 2013 and both were given sufficiency ratings of 74 with health indices of 82.34 and 75.13 for the culverts at MP 20.271 and 20.686 respectively. The culvert at Archie Creek was given a sufficiency rating of 74 as well and a health index of 48.79 after the last inspection on March 13, 2013.

The other bridge culvert (Bridge No. 100048) is located at Delaney Creek at MP 23.003. **This is located north of the expected limits of construction for this project.** This structure consists of triple 12'x8.25' barrels and was constructed in 1959 when the other bridge culverts were widened. This bridge culvert was last inspected on March 13, 2013 which resulted in the structure being given a sufficiency rating of 56.7 and a health index of 66.67. All of the box culverts have load ratings that exceed 1.0.

Table 4-11 Existing Bridge Culverts

Bridge Culvert No.	Year Built / Reconstructed	Sufficiency Rating	Health Index	NBI Rating	Last Inspection	Structure Type	Bridge Length	Load Rating	Span Length	Notes
US 41 over Archie Creek (MP 20.271)										
100046	1943 / 1959	74	82.34	N/A	3/21/2013	Double Barrel Culvert	33.9'	3.84 (H15)	10'x6'	Previously Widened
US 41 over Archie Creek North (MP 20.686)

4.2.2 Bullfrog Creek Bridges

A pair of bridges crosses Bullfrog Creek at MP 17.422 (**Figure 4-17**). Both of these bridges use reinforced concrete slabs with pile bents. The southbound bridge (Bridge No. 100044) is approximately 203 feet long and was originally constructed in 1960 and was reconstructed in 1986. The northbound bridge (Bridge No. 100106) was constructed in 1945 and is slightly longer than the southbound bridge with a total length of approximately 211 feet. Both of these bridges carry two lanes that are slightly less than 12 feet wide with a 4-foot sidewalk on the outside of the northbound bridge and a 3 foot-7½ inch sidewalk on the southbound bridge (**Figure 4-18**). The northbound bridge has shoulders 6 inches to 1 foot wide between the curb and the lanes while the southbound bridge has a 2 foot-6 inch inside shoulder and a 2 foot outside shoulder. The outside railing on the northbound bridge has been retrofitted with a vertical face concrete railing with a bullet rail on top but the substandard post-and-rail barrier on the inside has not been replaced. The railings on the southbound bridge have both been upgraded using the vertical face concrete rail retrofit.

US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Existing Bridge Typical Sections**	**Figure 4-18**

The Bullfrog Creek bridges were last inspected on March 15, 2013 and were assigned sufficiency ratings of 77.2 for the southbound bridge and 75.2 for the northbound bridge. Their health indices are 87.65 and 89.6 for the southbound and the northbound bridges, respectively. Both bridges are classified as *functionally obsolete* and have load ratings greater than 1.0, and the northbound bridge has been designated as *scour critical*. **Table 4-12** summarizes characteristics of the existing bridges (FO = Functionally Obsolete). In April 2015, the US Coast Guard determined that a bridge permit would not be required for the proposed bridge replacement at Bullfrog Creek.

Table 4-12 Characteristics of the Existing Bridges

FO = Functionally Obsolete

4.2.3 Alafia River Bridges

The second pair of bridges is about 1216 feet long and cross the Alafia River at MP 18.914 (**Figure 4-19**). The northbound bridge (Bridge No. 100107) was constructed in 1952 using continuous steel I-beams. The southbound bridge (Bridge No. 100045) was built in 1959 using AASHTO Type II beams with the 78-foot main span beam using post tensioning. This pair of bridges was built side-by-side and are actually separated by a longitudinal joint that is positioned just inside of the inside lane line of the southbound lanes so that the median barrier is located on the northbound bridge. Both the northbound and southbound bridges carry two lanes of traffic that range from 11 feet-11 inches to 12 feet-9 inches wide (**Figure 4-18**). Both shoulders on the northbound bridge and the outside shoulders on the southbound bridge are 2-foot wide while the inside shoulder of the southbound bridge is approximately 2 foot-10 inches. Both bridges use F-shaped barriers between the travel lanes and the sidewalks which are 3 feet-5 inches wide on the northbound bridge and 3 feet-4 inches wide on the southbound bridge. The original post-and-rail barrier is present on the outside of both sidewalks with a fence installed just inside of this barrier on just the northbound bridge. Dual arm light poles are mounted on the median barrier along the bridge.

Looking north along US 41 at the top of the bridges – note the narrow sidewalks and lack of shoulders and bike lanes

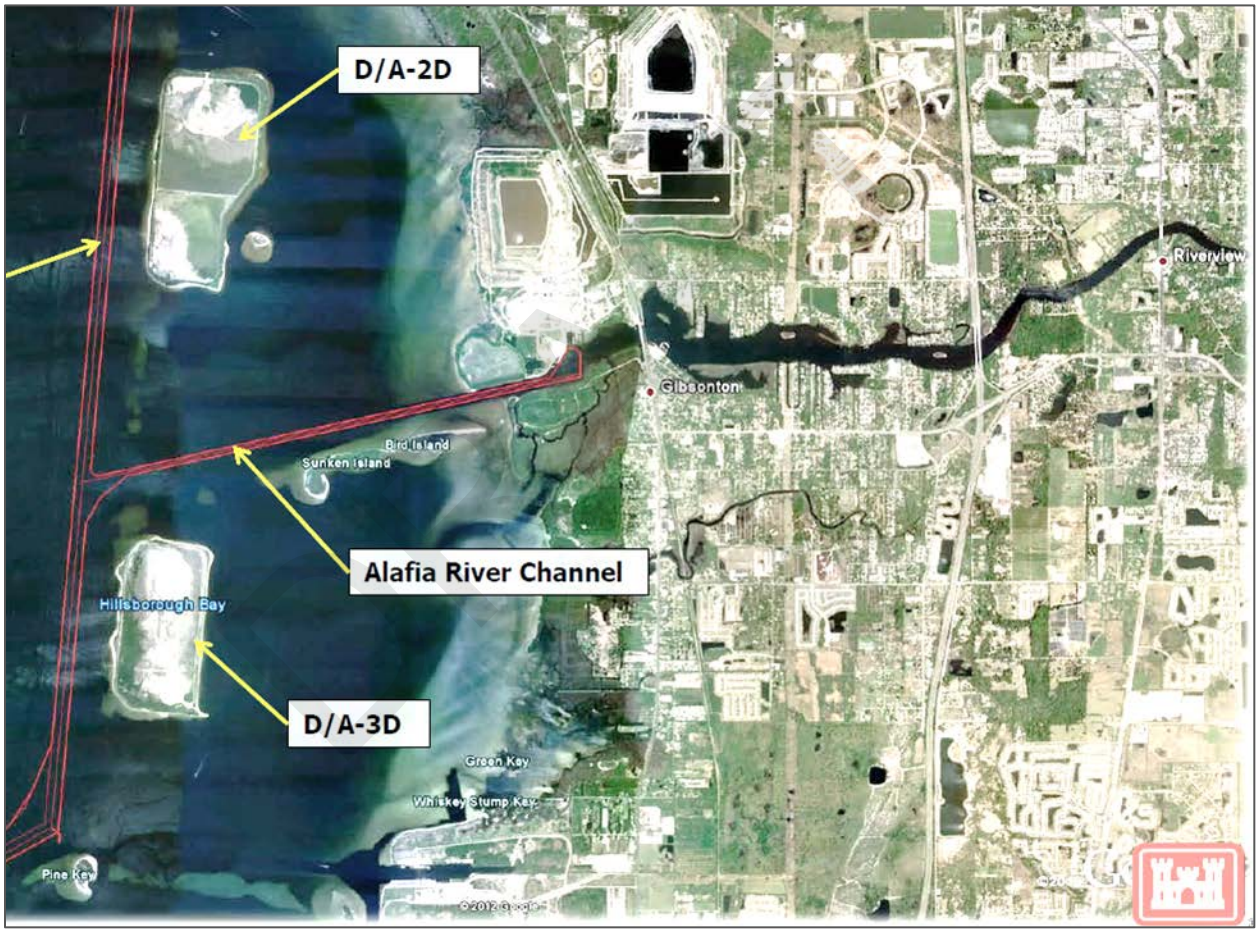
US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Photos of Alafia River Bridges P. 3 of 3**	**Figure 4-19**

The southbound bridge has a sufficiency rating of 78.9 and a health index of 87.64 while the sufficiency rating is 68 and the health index is 94.09 for the northbound bridge. These bridges were last inspected on March 22, 2013 and are both classified as *functionally obsolete* and have load ratings that exceed 1.0.

Based on FDOT's bridge comprehensive inventory data report, the existing bridges have vertical and horizontal navigational clearances of 29.8 feet and 48.8 feet, respectively. In addition, a field survey conducted on July 20, 2014 measured the vertical clearances above mean high water at 28.6 feet. These bridges span a navigable waterway and will require a US Coast Guard permit for any modifications. The Alafia River Channel provides access to private port facilities on the Alafia River, although the maintained channel ends west of the bridges, as shown in the graphic below.



SECTION 5 PLANNING PHASE/CORRIDOR ANALYSIS

A separate planning phase for this proposed project was not performed other than a screening in the FDOT's Efficient Transportation Decision Making (ETDM) system. A planning phase screen was not run for this proposed project in ETDM; however, a *Final Programming Screen Summary Report* was published on April 10, 2013 under ETDM Project Number 5180 for the proposed roadway improvements.

A separate corridor analysis was not conducted as part of this study since the purpose of this PD&E study was to identify concepts for widening the existing highway (within the existing corridor) consistent the MPO's Long-Range Transportation Plan.

SECTION 6 DESIGN CONTROLS AND STANDARDS

Proposed design controls, standards and criteria are shown below in **Table 6-1.**

Table 6-1 US 41 Design Controls and Criteria

All roadway typical sections were updated in December 2014 to show 7-foot buffered bike lanes in compliance with new FDOT design standards for urbanized areas.

SECTION 7 TRAFFIC DATA

The information in this section has been extracted from the project's *Traffic Technical Memorandum* (TTM).

7.1 EXISTING TRAFFIC VOLUMES AND TRAFFIC CHARACTERISTICS

Traffic counts were made within the study area during January and March 2013. The traffic count data included 72-hour classification counts performed at three locations, 72-hour approach machine counts performed at approaches to major intersections, and 4-hour turning movement counts performed at twelve intersections along the study corridor. Additional turning movement counts were conducted between 9 am and 1 pm when truck traffic was observed to be the highest at US 41 intersections at Riverview Drive, Madison Avenue and Port Sutton Road, all of which provide direct access to Port facilities. These special counts were conducted in order to size the future turn lanes at these intersections so that they can accommodate high-volume truck movements made throughout an average day.

The intersection of US 41 and SR 676 (Causeway Boulevard) was not studied as a part of this project. This intersection has been evaluated for a potential future grade separation under Work Program Item Segment No. 255599-1 – Traffic Operations Analysis for SR 676 (Causeway Boulevard) from SR 45 (US 41) to SR 43 (US 301).

Existing Traffic Characteristics

Table 7-1 below shows the recommended design traffic factors for the US 41 corridor, which were approved by District Seven on June 4, 2013.

Table 7-1 Recommended K, D, T Factors along US 41

US 41 Segment	Standard K	D	Daily Truck (T_{24})	Design Hour Truck (DHT)
Kracker Avenue to Gibsonton Drive/Alice Avenue	9.00%	64.27%	9.0%	5.0%
Gibsonton Drive to CR 676A (Madison Avenue/Pendola Point Road)			9.0%	5.0%
CR 676A (Madison Avenue) to south of SR 676 (Causeway Boulevard)			11.0%	5.0%

The design hour traffic factors recommended for the US 41 PD&E study include a standard K factor of 9.0 percent per FDOT's 2012 *Project Traffic Forecasting Handbook* (PTFH). The K-factor (or Design Hour Factor) is the ratio of the Annual Average Daily Traffic (AADT) that occurs during the design hour for the design year. The recommended Directional (D) factor for the study corridor is 64.27

percent based on the average of the D factors obtained from the 72-hour classification counts and the D factor along the study corridor as identified in the 2011 Florida Transportation Information (FTI) DVD. The recommended D factor along US 41 is within the acceptable range identified in the PTFH. D factors for the side streets were estimated from the actual AM and PM peak-hour turning movement counts.

Recommended daily truck percentage (T_{24}) along the study corridor based on the 72-hour classification counts are 9.0 percent between Kracker Avenue and Gibsonton Drive/Alice Avenue and between Gibsonton Drive/Alice Avenue and CR 676A (Madison Avenue/Pendola Point Road); and, 11.0 percent between CR 676A (Madison Avenue/Pendola Point Road) and south of SR 676 (Causeway Boulevard). For the side streets, the design hour truck (DHT) factors were based on the AM and PM peak-hour turning movement counts. DHT for US 41 was assumed to be half of T_{24}, and was rounded up to the nearest percent.

Existing (2013) Traffic Volumes

The existing AADT volumes were obtained by applying a seasonal adjustment factor and axle adjustment factor to the raw average daily traffic (ADT) counts from the 72-hour approach counts. The adjustment factors were obtained from 2011 FTI DVD. These seasonally and axle adjusted existing AADT volumes are shown in **Figure 7-1**.

The "existing year" (2013) AM and PM peak hour directional design hour volumes (DDHV) were obtained by multiplying the existing AADT volumes by the recommended K and D factors of 9.0 percent and 64.27 percent, respectively. The AM and PM peak hour turning movement volumes were developed by multiplying the existing turning percentages with the DDHV estimated from AADTs. The existing turning percentages were obtained from the AM (proposed peak: 7:00 AM – 8:00 AM) and the PM (proposed peak: 4:45 PM – 5:45 PM) peak hour raw turning movement counts. Based on the traffic counts, southbound was considered to be the peak direction during the PM peak period and northbound was used as the AM peak direction. Peak directions for side streets were obtained from the existing traffic counts. The existing year (2013) AM and PM peak-hour volumes are shown in **Figure 7-2**.

Figure 7-2

7.2 EXISTING LEVELS OF SERVICE

The existing year (2013) lane geometry and approved existing AM and PM peak hour traffic volumes, along with signal timing plans obtained from Hillsborough County were used for the existing conditions analysis. The acceptable Level of Service (LOS) standard for the US 41 study corridor in the "FHWA urbanized area" from Kracker Avenue to south of SR 676 (Causeway Boulevard) is LOS D based on the Planning Boundaries for LOS standards map for Hillsborough County. SYNCHRO Version 7.0 (Build 759) was used as the analysis tool within the study limits. Signalized intersection LOS was estimated from the Highway Capacity Manual (HCM) module of the SYNCHRO software. The Highway Capacity Software (HCS+) Version 5.5 was used for the unsignalized intersections. The unsignalized intersection module of the HCS cannot analyze six lane roadways; in these cases, the unsignalized analysis is performed assuming two through lanes on each approach and using two-thirds of the through traffic volume. This approach for the analysis of the unsignalized intersections was discussed and agreed upon with FDOT. The existing year LOS and control delay results for the study intersections are summarized in **Table 7-2**.

Table 7-2 Existing Year (2013) AM/PM Intersection Delay and LOS Summary

Intersection Along US 41	Overall Average Delay (seconds/vehicle)	Overall Intersection V/C Ratio	Overall Intersection LOS
US 41 at Kracker Avenue* (un-signalized)	30.3/24.8	-	D/C
US 41 at Ohio Street* (un-signalized)	30.2/15.9	-	D/C
US 41 at Florence Street* (un-signalized)	24.6/36.8	-	C/E
US 41 at Symmes Road	28.6/13.4	0.83/0.58	C/B
US 41 at Palm Avenue	13.3/8.6	0.70/0.61	B/A
US 41 at Nundy Avenue* (un-signalized)	106.8/27.0	-	F/D
US 41 at Gibsonton Drive/Alice Avenue	52.6/33.7	0.93/0.81	D/C
US 41 at Riverview Drive/Industrial Access Road	13.9/14.4	0.70/0.72	B/B
US 41 at CR 676A (Madison Avenue/Pendola Point Road)	65.4/40.9	0.92/0.81	E/D
US 41 at Port Sutton Road	10.8/15.3	0.71/0.79	B/B
US 41 at Hartford Street* (un-signalized)	24.1/124.4	-	C/F

**Un-signalized Intersection – Delay/LOS along worst minor approach.*

Based on the existing analysis, with the exception of the intersections of US 41 at Florence Street, Nundy Avenue, CR 676A (Madison Avenue/Pendola Point Road) and Hartford Street, all the other study intersections operate at an acceptable level of service LOS D or better during both peak periods.

SYNCHRO Version 7.0 (Build 759) was used as the roadway segment analysis tool. The existing year (2013) roadway segment LOS analyses were conducted for US 41 using the existing year (2013) peak

hour volumes. For the roadway segment analysis, the free flow speed was assumed to be the posted speed limit which varies between 40 mph and 55 mph within the project limits. The arterial class for US 41 was established to be Class I by SYNCHRO software. The existing roadway segment LOS results for the northbound and southbound directions of US 41 are summarized in **Table 7-3**. These results are also graphically displayed in **Figure 7-3**.

Table 7-3 Existing Year (2013) AM/PM Roadway Segment Speed and LOS Summary

Roadway	Segment	Existing Condition		
		Distance (mi)	Arterial Speed (mph)	Roadway Segment LOS
US 41 NB	Southern Project Limit to Symmes Road	2.03	42.1/46.2	A/A
	Symmes Road to Palm Avenue	0.42	25.0/27.9	D/C
	Palm Avenue to Gibsonton Drive/Alice Avenue	0.59	19.8/28.0	E/C
	Gibsonton Drive/Alice Avenue to Riverview Drive/Industrial Access Road	1.03	41.4/44.2	B/A
	Riverview Drive/Industrial Access Road to CR 676A (Madison Avenue/Pendola Point Road)	2.77	41.0/44.8	B/A
	CR 676A (Madison Avenue/Pendola Point Road) to Port Sutton Road	0.36	30.1/33.0	C/C
	Port Sutton Road to south of SR 676 (Causeway Boulevard)	1.16	31.3/34.4	C/B
US 41 SB	South of SR 676 (Causeway Boulevard) to Port Sutton Road	1.16	45.7/41.1	A/B
	Port Sutton Road to CR 676A (Madison Avenue/Pendola Point Road)	0.36	23.2/20.6	D/E
	CR 676A (Madison Avenue/Pendola Point Road) to Riverview Drive/Industrial Access Road	2.77	52.0/50.5	A/A
	Riverview Drive/Industrial Access Road to Gibsonton Drive/Alice Avenue	1.03	40.1/37.5	B/B
	Gibsonton Drive/Alice Avenue to Palm Avenue	0.59	46.0/43.7	A/A
	Palm Avenue to Symmes Road	0.42	32.4/34.2	C/B

Based on these results, the existing analysis shows that the section of US 41 between Palm Avenue and Gibsonton Drive/Alice Avenue does not operate at an acceptable level of service in the northbound direction during the AM peak period. In addition, the segment between Port Sutton Road and CR 676A (Madison Avenue/Pendola Point Road) in the southbound direction does not operate at an acceptable level of service during the PM peak period.

7.3 ASSUMPTIONS AND METHODOLOGY FOR FUTURE TRAFFIC PROJECTIONS

Per the traffic methodology approved by FDOT in January 2013, only one set of future traffic volumes were developed that were used for both the no-build and the build conditions. Future year traffic volumes were developed using the Tampa Bay Regional Planning Model (TBRPM) Version 7.1. A base year (2006) model validation (reasonableness check) was performed for the study area along US 41 from Kracker Avenue to Causeway Boulevard. Adjustments were made to the base year model to improve the accuracy levels of the model volumes. Details on subarea validation are included in the TTM Appendices. The process and results of subarea validation were coordinated and approved by FDOT on April 8, 2013. These subarea refinements including modifications to centroid connectors and facility types were applied to the future year 2035 model for the build scenario with six lanes along US 41. Based on the results of the subarea validation, FDOT recommended that NCHRP 255 adjustment techniques (Ratio and Difference Method) be applied to the future year 2035 model volumes along US 41 and along several major side streets. In addition, FDOT recommended using growth rates for several minor side streets and along minor approaches at major side streets. The growth rates used were based on a comparison of the socioeconomic data between the base year (2006) and future year (2035) for the traffic analysis zones adjacent to the individual side streets. Based on this approach, an annual growth rate of 3.04 percent was recommended for the minor side streets and an annual growth rate of 1.81 percent was recommended for the minor approaches for the major side streets. The NCHRP 255 adjusted model volumes and recommended growth rates were approved by FDOT on April 8, 2013 and May 16, 2013.

7.4 FUTURE TRAFFIC PROJECTIONS

The opening year (2020), interim year (2030) and design year (2040) AADT were obtained by interpolation and extrapolation between the existing (2013) AADT and the established 2035 future model volumes for the US 41 volumes and the major side streets within the project limits. For the minor side streets and the minor approaches at the major side streets, growth rates were used as described above. The future year no-build and build AADT are shown in **Figure 7-4**. A graphical comparison of existing and future AADTs is included in **Figure 7-5**.

The future year AM and PM peak Directional Design Hour Volumes (DDHV) were obtained by multiplying the future year AADTs by the recommended K and D factors, respectively. These estimated DDHV were then distributed at the study intersections by applying the existing turning percentages from the existing traffic counts. As in the existing year (2013), southbound is considered to be the peak direction along US 41 within the project limits during the PM peak period and northbound is considered to be the peak direction during the AM peak period. Peak directions for side streets were obtained from the existing traffic counts. The future no-build/build AM and PM peak hour volumes for the design year (2040) are shown in **Figure 7-6**; volumes for the opening and interim years are available in the TTM. Future traffic volumes were reviewed and approved by FDOT on June 4, 2013.

7.5 SIGNAL WARRANT ANALYSES

In conducting the future traffic operational analysis, the potential for future signalization at unsignalized intersections was evaluated using a planning-level analysis. Based on the analysis, it appeared that some unsignalized intersections may need future traffic signals. However, the need for a traffic signal must be met by meeting specific warrants as established in the US DOT Manual on Uniform Traffic Control Devices (MUTCD) and FDOT's Manual on Uniform Traffic Studies (MUTS).

Planning-level evaluation of MUTCD signal warrant numbers 1 and 2 was conducted for the locations shown below in **Table 7-4**. Warrants were evaluated using the two peak hour – AM and PM volumes available for the future years.

Table 7-4 Planning Level Signal Warrant Evaluation at Unsignalized Intersections

Unsignalized Intersection	Signal Warrant*	Opening Year 2020	Interim Year 2030	Design Year 2040	Recommendation
US 41 @ Kracker Avenue	1	Not Satisfied	Not Satisfied	Not Satisfied	Traffic Signal not recommended due to low traffic volumes.
	2	Not Satisfied	Not Satisfied	Not Satisfied	
US 41 @ Ohio Street	1	Not Satisfied	Not Satisfied	Not Satisfied	Traffic Signal not recommended due to low traffic volumes.
	2	Not Satisfied	Not Satisfied	Not Satisfied	
US 41 @ Florence Street	1	Not Satisfied	Not Satisfied	Not Satisfied	Traffic Signal not recommended due to low traffic volumes. Also, Access Management Signal Spacing requirement of 2640 feet not available.
	2	Not Satisfied	Not Satisfied	Not Satisfied	
US 41 @ Nundy Avenue	1	Not Satisfied	Not Satisfied	Not Satisfied	Traffic Signal not recommended. Also, Access Management Signal Spacing requirement of 2640 feet not available.
	2	Not Satisfied	Not Satisfied	Not Satisfied	
US 41 @ Hartford Street	1	Not Satisfied	Not Satisfied	Not Satisfied	Traffic Signal not recommended due to low traffic volumes. Also, Access Management Signal Spacing requirement of 2640 feet not available.
	2	Not Satisfied	Not Satisfied	Not Satisfied	

**Only AM and PM peak hours.*

Exclusive right-turn lanes were considered as a part of the future lane geometry for the westbound approach at unsignalized locations of Ohio Street, Nundy Avenue and Hartford Street. This allows the considerably higher volume westbound right-turns at these intersections to experience lesser delays.

Based on the planning level evaluation of signal warrants 1 and 2, none of the unsignalized intersections along US 41 within the project limits are warranted for the installation of a traffic signal at this time.

7.6 FUTURE LEVELS OF SERVICE

All signalized, unsignalized intersections and roadway segments were evaluated for all analysis years for both the AM and PM peak conditions under both the no-build and the build scenarios to determine the future LOS. Only the results for the design year are included here; the full analysis results are included in the TTM. The same analysis tools were used as for the existing LOS analysis described earlier.

The no-build condition assumes the existing lane geometry is still in place with four lanes on US 41. The build scenario assumes US 41 to be widened to six lanes within the project limits. The proposed build condition assumes a 50 mph design speed with the exception of the segment between Symmes Road and Riverview Drive/Industrial Access Road where the proposed design speed is 45 mph. Posted speed limits were assumed to be 5 mph lower than the design speeds. The build analysis also considers additional side street improvements required for US 41 to operate at an acceptable LOS.

Design Year No-Build Alternative LOS

The 2040 no-build estimated LOS for signalized and unsignalized intersections within the study area is summarized in **Table 7-5**. Signal timings were optimized as a part of the future year analysis. Based on the 2040 no-build intersection analysis, all of the study intersections fail to operate at an acceptable level of service during one or both peak periods.

Table 7-5 Design Year (2040) No-Build AM/PM Intersection Delay and LOS Summary

Intersection	Overall Average Delay (seconds/vehicle)	Overall Intersection V/C Ratio	Overall Intersection LOS
US 41 at Kracker Avenue* (unsignalized)	358.6/116.4	-	F/F
US 41 at Ohio Street* (unsignalized)	596.3/39.5	-	F/E
US 41 at Florence Street* (unsignalized)	80.9/246.5	-	F/F
US 41 at Symmes Road	157.9/47.0	1.71/0.99	F/D
US 41 at Palm Avenue	61.0/26.7	1.07/0.91	E/C
US 41 at Nundy Avenue* (unsignalized)	-(1)/-(1)	-	F/F
US 41 at Gibsonton Drive/Alice Avenue	178.2/150.9	1.59/1.45	F/F
US 41 at Riverview Drive/Industrial Access Road	170.2/153.2	1.49/1.52	F/F
US 41 at CR 676A (Madison Avenue/Pendola Point Road)	205.9/161.1	1.51/1.34	F/F
US 41 at Port Sutton Road	116.4/174.9	1.24/1.44	F/F
US 41 at Hartford Street* (unsignalized)	-(1)/901.2	-	F/F

**Unsignalized Intersection – Delay/LOS along worst minor approach.*
(1) Delay exceeds software capacity.

LOS analysis was also conducted for segments for the same no-build scenario; the results are shown in **Table 7-6**. Several segments operate at an acceptable level of service in either direction during one or both peak periods. **Figure 7-7** includes a simple graphic summary of the LOS results for the 2040 no-build condition for both signalized intersections and segments.

Table 7-6 Design Year (2040) No-Build AM/PM Roadway Segment Speed and LOS Summary

Roadway	Segment	No-Build Condition		
		Distance (mi)	Arterial Speed (mph)	Roadway Segment LOS
US 41 NB	Southern Project Limit to Symmes Road	2.03	26.0/37.7	D/B

WPI Segment No. 430056 1 - Hillsborough County

Design Year 2040 Proposed Lane Geometry

Figure 7-8

Based on the results of the 2040 build intersection analysis shown in the table above, all intersections would operate at an acceptable level of service except the minor approaches of the unsignalized intersections which would not operate at an acceptable level of service during AM peak or PM peak or both. If major county road "side streets" are not widened ("side street no build" case) the intersection levels of service would worsen as shown in the last column of the table.

The 2040 build alternative estimated LOS for roadway segments within the study area is summarized in **Table 7-8** below.

Table 7-8 Design Year (2040) Build AM/PM Roadway Segment Speed and LOS Summary

Roadway	Segment	Build Condition		
		Distance (mi)	Arterial Speed (mph)	Roadway Segment LOS
US 41 NB	Southern Project Limit to Symmes Road	2.03	36.2/38.9	A/A
	Symmes Road to Palm Avenue	0.42	25.7/29.1	C/B
	Palm Avenue to Gibsonton Drive/Alice Avenue	0.59	18.9/22.1	D/C
	Gibsonton Drive/Alice Avenue to Riverview Drive/Industrial Access Road	1.03	26.3/30.1	C/B
	Riverview Drive/Industrial Access Road to CR 676A (Madison Avenue/Pendola Point Road)	2.77	35.6/38.7	A/A
	CR 676A (Madison Avenue/Pendola Point Road) to Port Sutton Road	0.36	23.7/31.4	C/B
US 41 SB	Northern Project Limit to Port Sutton Road	1.16	40.0/29.3	A/B
	Port Sutton Road to CR 676A (Madison Avenue/Pendola Point Road)	0.36	26.7/21.6	C/D
	CR 676A (Madison Avenue/Pendola Point Road) to Riverview Drive/Industrial Access Road	2.77	39.8/38.3	A/A
	Riverview Drive/Industrial Access Road to Gibsonton Drive/Alice Avenue	1.03	33.1/28.5	B/B
	Gibsonton Drive/Alice Avenue to Palm Avenue	0.59	32.8/28.9	B/B
	Palm Avenue to Symmes Road	0.42	27.7/28.5	C/B

Based on the results of the 2040 build roadway segment analysis, all the segments along US 41 would operate at an acceptable level of service during both peak periods in both the northbound and the southbound directions.

7.7 RECOMMENDED INTERSECTION IMPROVEMENTS

Figure 7-8 shows the proposed 2040 build geometry along US 41 with the intersection improvements that are needed to operate at an acceptable LOS D with several triple left and right turn lanes along US 41 and the side-streets. Triple left turn lanes are recommended along the westbound and southbound approach at Gibsonton Drive/Alice Avenue, westbound approach at Riverview Drive/Industrial Access Road and southbound approach at CR 676A (Madison Avenue/Pendola Point Road). Triple right turn lanes are recommended along the westbound approach at CR 676A (Madison Avenue/Pendola Point Road). Recommended lengths for auxiliary left- and right-turn lanes are included in Section 9 of this report.

Additional analysis was performed at the intersections of US 41 at Symmes Road, Gibsonton Drive/Alice Avenue, Riverview Drive/Industrial Access Road and CR 676A (Madison Avenue/Pendola Point Road) with no-build conditions along side streets with six-laning of US 41. This was based on a meeting with Hillsborough County held on October 31, 2013 as the county has no plans for widening the side streets with the exception of CR 676A (Madison Avenue/Pendola Point Road). Hillsborough County MPO's 2035 Highway Needs Plan shows widening of CR 676A (Madison Avenue/Pendola Point Road) to four lanes. The results of this additional analysis are shown in **Table 7-7**. The results of the analysis indicate that these intersections will not operate at an acceptable LOS D with dual left- and right-turn lanes only.

SECTION 8 ALTERNATIVES ANALYSIS

8.1 NO-BUILD/REHABILITATION/REPAIR ALTERNATIVE

The No-Build Alternative would not construct the US 41 improvements. Rather, it would leave the existing roadway in its current configuration, except for other intersection or safety improvements planned in the future. The No-Build Alternative requires no additional expenditure of funds and has no environmental impacts. However, the No-Build Alternative fails to fulfill the project's purpose and need and fails to meet the goals of the MPO's LRTP. The No-Build Alternative will remain a viable alternative throughout the study process and serve as the basis of comparison for the Build Alternatives.

8.2 TRANSPORTATION SYSTEM MANAGEMENT AND OPERATIONS (TSM&O)

The objective of Transportation System Management & Operations (TSM&O) is to identify strategies that reduce existing traffic congestion and prevent its occurrence in areas that are currently congested. These strategies are designed to modify travel behavior and increase system efficiency without costly infrastructure improvements. TSM&O strategies are implemented when one or more of the following occurs:

- Insufficient funds available to meet system improvement needs,
- Increased construction costs for new roadways and transit facilities,
- Increased need to improve operational efficiency, and/or changes in travel patterns.

TSM&O options generally include traffic signal and intersection improvements, access management, and transit improvements. For this proposed project, it was determined that the additional capacity required to meet the projected traffic volumes along US 41 in the design year cannot be provided solely through the implementation of TSM&O improvements.

8.3 MULTIMODAL FACILITIES

The Hillsborough Area Regional Transit (HART) Authority currently operates local bus route no. 31 on US 41 south of Gibsonton Drive and on Gibsonton Drive east of US 41. They also operate limited express route no. 47LX in the same location. According to HART's *Transit Development Plan Update for Fiscal Years 2015 thru 2024*, HART has no plans to extend bus service on US 41 to the north of Gibsonton Drive. Expansion of the existing roadway would help improve mobility for these existing bus routes within the study limits. Bicycle and pedestrian accommodations will also be included as part of the proposed improvements, including bridge crossings for the future South Coast Greenway.

US 41 is part of the highway network that provides access to regional intermodal facilities such as the Port of Tampa and Port Manatee. Improvements to US 41 would enhance access to activity centers in the area and would improve movement for freight in the Tampa Bay region and across the state.

While the multimodal and transit alternatives have the potential to improve traffic operations along the corridor, these alternatives fail to fulfill the purpose and need for the proposed project on their own within the study area. Therefore, multimodal/transit alternatives were not considered as stand-alone solutions for the existing and expected transportation demand deficiencies within the study area.

8.4 BUILD ALTERNATIVES

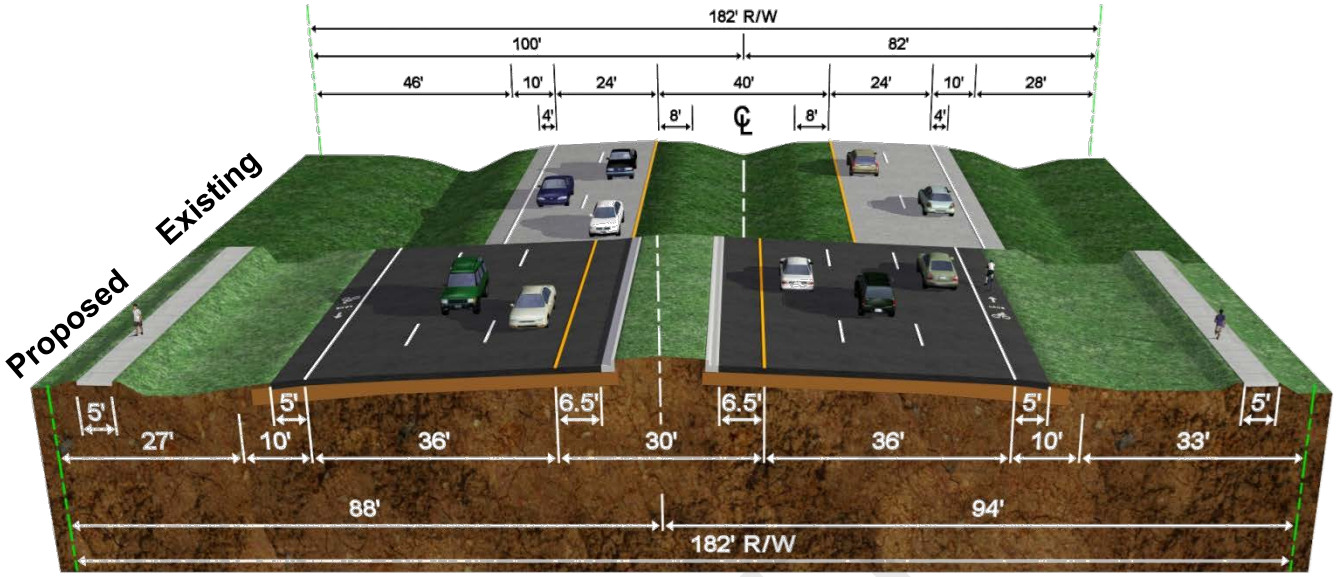
The following steps were utilized to develop and evaluate viable alternatives:

- Base concept plans were prepared using all available data, including county GIS data, as-built plans, FDOT ROW maps, and subdivision plats
- The project was divided into three major segments to facilitate evaluation
- The required number of through lanes and major intersection geometry was determined based on the traffic analysis summarized in Section 7
- Typical sections were developed based on FDOT's standard design criteria
- Alternative alignments were developed for the north Gibsonton area to minimize ROW costs and environmental impacts
- The Build Alternatives were evaluated using an evaluation matrix.
- A Recommended Build Alternative was selected

8.4.1 Typical Sections

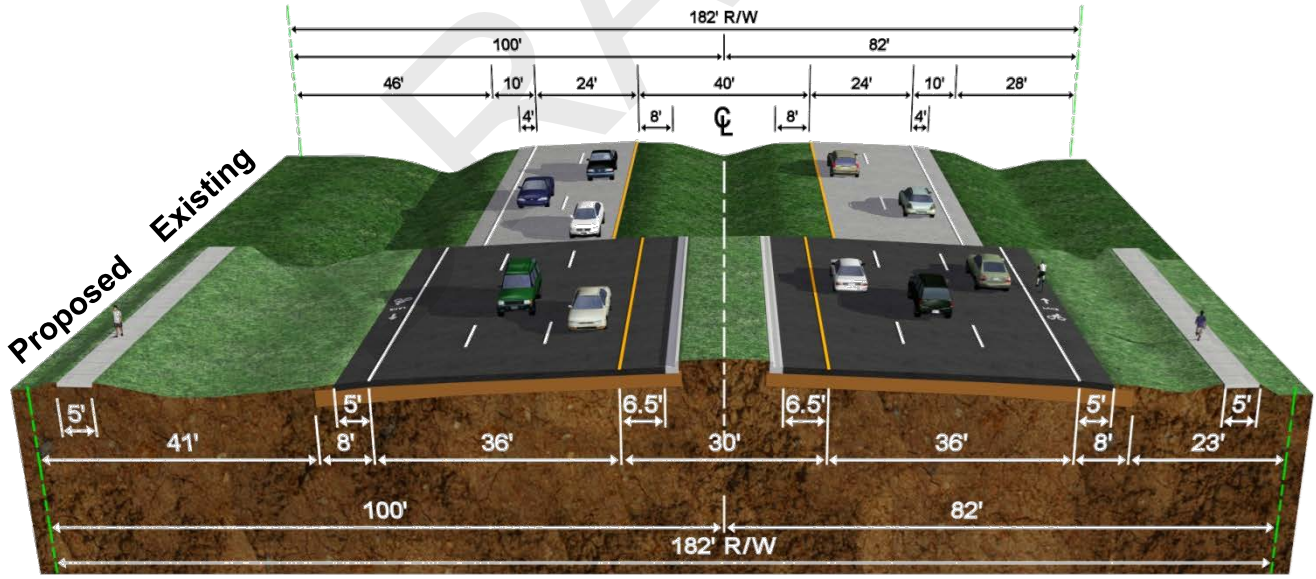
For the areas outside of the north Gibsonton area, which are more "rural" in nature (even though they fall within the FHWA urban area boundary), only six-lane suburban typical sections were considered since six-lane rural typical sections would have required ROW acquisition. For most of these areas, the existing ROW is 182 feet in width, with the centerline of the existing four-lane rural highway offset by 9 feet within the ROW. Initially, suburban typical sections with 40-foot medians were considered; however, it was determined that these would have required a design variation for the border width, so a suburban typical section with a 30-foot median was developed. For the suburban typical section alternatives, two different alignments were considered within the existing ROW, as shown in **Figure 8-1**. All of these include 6.5-foot inside shoulders, 5-foot paved outside shoulders/bike lanes and sidewalks on both sides. Based on a review of the temporary traffic control plans for each alternative (**Appendix A**), it was determined that the suburban typical sections that utilize the existing pavement are the best option.

Alternatives Between Kracker Ave. & Palm Ave.
(Near the South End of the Project)



"West-Shifted Suburban" Typical Section Alternative

- Provides 50 mph design speed
- No design variation for border width required
- Construction cost is higher than for the alternative shown below
- No additional ROW required



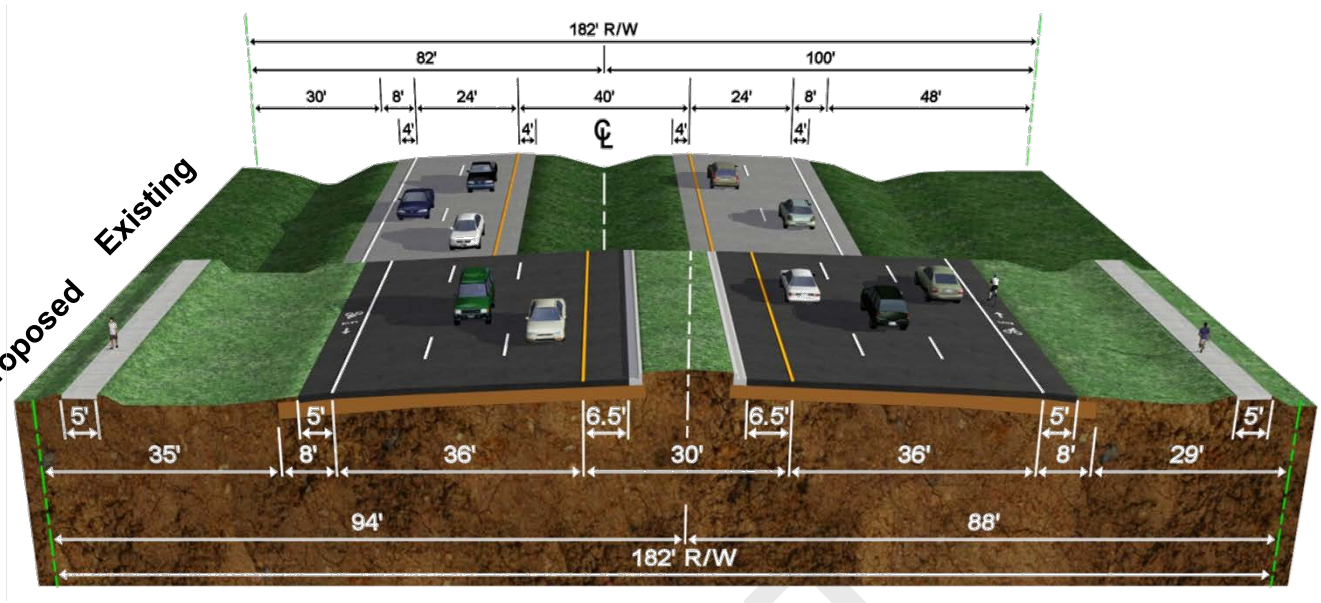
Suburban Alternative Utilizing the Existing Pavement

- Provides 50 mph design speed
- No design variation for border width required
- No additional ROW required

(All views are looking north)

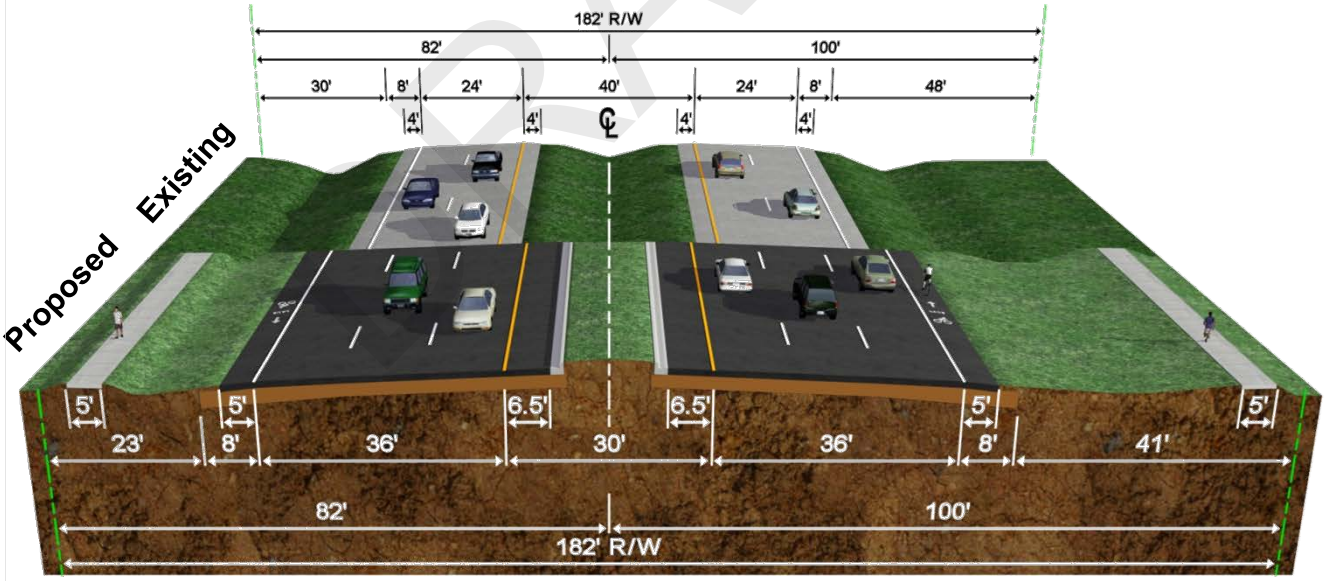
Rev. 10/15/13

Alternatives Between Alafia River Bridge & Denver Street (Near the North End of the Project)



"East-Shifted Suburban" Typical Section Alternative

- Provides 50 mph design speed (required for SIS Connector Segment north of Pendola Point)
- No design variation for border width required
- Construction cost is higher than for the alternative shown below
- No additional ROW required



Suburban Alternative Utilizing the Existing Pavement

- Provides 50 mph design speed (required for SIS Connector Segment north of Pendola Point)
- No design variation for border width required
- No additional ROW required

(All views are looking north)

Rev. 10/15/13

FDOT **US 41(SR 45) PD&E Study** ***From Kracker Avenue to South of SR 676 (Causeway Blvd)*** WPI Segment No. 430056 1 - Hillsborough County	**Alternative Suburban Typical Sections**	**Figure 8-1** Page 2 of 2

For the north Gibsonton area, where the existing ROW is much narrower, urban typical sections are the only reasonable alternatives to consider. Basic six-lane urban typical sections are shown in **Figure 8-2**. The proposed median width varies considerably due to the need to tie in to the future bridge typical section at the Alafia River and the need for future triple left turn lanes at the Gibsonton Drive intersection. Both typical sections include 12-foot lanes (these could be reduced during the design phase, if necessary), 4-foot bicycle lanes, and 6-foot sidewalks adjacent to the curb and gutter. The recommended typical section north of Gibsonton Drive would maintain the existing joint-use ditch on the east side (to the maximum extent possible) which conveys runoff from both US 41 and the CSX railroad line which runs adjacent to US 41 between Gibsonton Drive and the Alafia River. Any alterations to this ditch would likely require either a temporary construction easement (TCE) or license agreement from CSX.

8.4.2 Alternative Alignments

Alternative alignments were evaluated for the north Gibsonton area, since ROW acquisition will be required for expanding the existing highway to six thru lanes. Alternatives evaluated are summarized in **Table 8-1**. Segments 2 and 3 in the table encompass the north Gibsonton area, for which centered, left- and right-shifted alignments were considered. The other locations/segments in the table summarize ROW cost estimates made for the other locations for which additional ROW will be needed. The comments in the table explain the rationale for the recommendations.

8.5 EVALUATION MATRIX

See **Section 8.4.2** above.

8.6 RECOMMENDED ALTERNATIVE

The recommended Build Alternative for the areas outside of north Gibsonton (where the existing ROW is 182 feet wide) is the suburban typical section with a 30-foot median aligned to utilize the existing pavement to the maximum extent possible (**Figure 8-3**). For the north Gibsonton area, the recommended alternative is the six-lane urban typical section with varying median width, following the alignment indicated in the evaluation matrix and as shown on the conceptual design plans included in **Appendix G.** All recommended typical sections were updated in December 2014 to show minimum 7-foot buffered bike lanes in compliance with new FDOT policy and design standards for urbanized areas.

Rev. 12/12/14

US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Recommended Suburban Typical Sections**	**Figure 8-3**

SECTION 9 DESIGN DETAILS OF RECOMMENDED ALTERNATIVE

9.1 DESIGN TRAFFIC VOLUMES

Design year (2040) AADTs was previously shown in **Figure 7-4**, and year 2040 directional design hour volumes were previously shown in **Figure 7-6**.

9.2 TYPICAL SECTIONS AND DESIGN SPEED

Recommended typical sections for the areas to the south and north of north Gibsonton were previously shown in **Figure 8-3,** and recommended urban typical sections for the north Gibsonton area were previously shown in **Figure 8-2**. The proposed design speed for the urban typical sections is 45 mph and the proposed design speed for the suburban typical sections is 50 mph.

The value engineering study recommended use of 11-foot interior lanes for the suburban typical section areas. This would require a design variation, and it will be considered further during the future final design phase.

9.3 INTERSECTION CONCEPTS AND SIGNAL ANALYSIS

Recommended geometry (laneage) for major intersections was previously shown in **Figure 7-8**. The intersection storage lengths for the signalized intersections were calculated for the design year 2040 build conditions based on the Institute of Transportation Engineers (ITE) "red-time" formula. The recommended turn lane lengths were rounded to the nearest 25 feet increment and are shown in **Table 9-1**. At the intersections of Riverview Drive/Industrial Access Road, CR 676A (Madison Avenue/Pendola Point Road) and Port Sutton Road which provide direct access to the Port of Tampa, storage lane lengths have also been estimated using truck percentages from the special turning movement counts that were conducted during the hours when truck traffic was observed to be highest so that the proposed turn lane can accommodate the truck volumes. The detailed calculation for the queue lengths and the turn lane lengths are included in Appendix I of the *Traffic Technical Memorandum*.

Also, the left-turn lane and the right-turn storage lane lengths along US 41 at the unsignalized intersections were estimated for the 2040 build conditions based on *Figure 3-15 of the Manual of Uniform Minimum Standards for Design, Construction and Maintenance for Streets and Highways (Florida Green Book), May 2011*.

Based on recommendations included in the value engineering study, concrete pavement should be considered for the approach lanes at the following intersections due to heavy truck traffic:

- US 41 at Madison Avenue
- US 41 at Port Sutton Road
- US 41 at Riverview Drive

To facilitate pedestrian crossings on US 41 at Gibsonton Drive and Madison Avenue, two-stage crossings utilizing the median for refuge may be needed due to the proposed width of US 41.

9.4 HORIZONTAL AND VERTICAL ALIGNMENT

The proposed design concept generally follows the existing horizontal and vertical alignment due to ROW constraints. A proposed profile grade will be determined during the future design phase when survey data is available.

Table 9-1 Design Year (2040) Build Recommended Turn Lane Lengths

(1) Based on thru lane queue as thru lane queue exceeds storage length for turn lanes.

9.5 RIGHT OF WAY NEEDS AND RELOCATIONS

Proposed locations and acreages of ROW to be acquired are summarized in **Table 8-1** in **Section 8.** In addition, specific locations for proposed ROW acquisition are shown on the preliminary conceptual design plans included in **Appendix G**. In addition to ROW for the roadway and intersection improvements, approximately 26 acres of ROW would be needed for storm water treatment facilities (mostly ponds) and 14.2 acres would be needed for floodplain impact compensation sites, as shown later in **Section 9.16**. Based on the preliminary conceptual design plans, an estimated 5 business and 2 residential relocations are expected (in the north Gibsonton area) as a result of construction of the recommended Build Alternative. This number is expected to change as businesses in Gibsonton come and go over time.

9.6 COST ESTIMATES

Preliminary cost estimates for the Build Alternative are included in **Table 9-2**. Estimated construction costs, as summarized in **Table 9-3**, are based on FDOT's Long Range Estimate (LRE) cost estimating system, and include temporary traffic control, mobilization and an initial contingency. Bridge replacements at Bullfrog Creek and the Alafia River account for approximately 37 percent of the construction cost estimate.

Table 9-2 Estimated Costs for the Build Alternative

Component	Estimated Cost ($millions)
Construction of Roadway, Bridges and Ponds[1]	110
Right of Way for Roadway Only	14
Right of Way for Stormwater Ponds and Floodplain Compensation Sites	17
Wetlands Mitigation	1.0 +/-
Design & Construction Inspection (20%)	$22
Totals	$164

[1]Based on LRE run on September 22, 2015.

9.7 RECYCLING AND SALVAGEABLE MATERIALS

During construction of the project, recycling of reusable materials will occur to the greatest extent possible. Where feasible, removal and recycling of the existing pavement and base material for use in the new pavement will be considered. This will help reduce the volume of the materials that need to hauled away and disposed of potentially reduce the cost of purchasing new materials for construction. Other materials such as signs, drainage pipes, etc., will also be salvaged and reused for regular maintenance operations if they are deemed to be in acceptable condition.

9.8 USER BENEFITS (SAFETY, ETC.)

The public will realize benefits after the proposed improvements are constructed. Savings in travel time, reduced vehicle operating costs, reduced traffic crash related costs and reduced emergency response times are the primary benefits. The proposed accommodations for the future South Coast Greenway trail at several locations will provide a safe facility for transportation and recreational opportunities for walkers and joggers, in-line skaters, bicyclists, and other non-motorized users. Pedestrian and bicycle safety will be enhanced by providing sidewalks and bike lanes along the entire project corridor. Pedestrian crosswalks, curb ramps, and pedestrian signals will be provided as a part of the recommended design. These will help to improve safety for pedestrians and bicyclists.

9.9 MULTIMODAL CONSIDERATIONS

No expansion of the current local and limited express bus services on US 41 south of Gibsonton Drive is currently planned by HART. Coordination with HART will occur during the design phase to potentially include bus bays/turnouts at selected bus stop locations.

9.10 ECONOMIC AND COMMUNITY DEVELOPMENT

As previously discussed in **Section 3.2**, traffic demand is expected to steadily increase in the coming years due to the many planned developments in southern Hillsborough County and the Brandon area. Expanding the capacity of this highway facility will help facilitate economic growth within southern Hillsborough County, improve mobility, and provide safer access to the many businesses and residences located along the project.

9.11 TEMPORARY TRAFFIC CONTROL PLAN

Three different temporary traffic control plan concepts were evaluated for the recommended suburban typical section, as shown in **Appendix A**. It was determined that utilizing the existing pavement and widening to the median first would be the best alternative, for these reasons:

- There is one less construction phase compared to the other two alternatives
- Less temporary barrier wall would be required, and
- Less temporary overbuild pavement would be required

The construction zone traffic speed would have to be reduced to 45 mph to reduce the offset distance required to the temporary barrier wall.

US 41 provides access to many businesses along this corridor. Due to its importance, the existing four travel lanes should be maintained to the maximum extent possible during construction. Lane closures, if necessary, should occur during night or other off-peak hours.

The following conceptual construction sequence will help maintain traffic operations along US 41:

- Relocate existing utilities within the newly-expanded ROW in north Gibsonton; elsewhere, relocate them within the existing ROW as required.

- Construct ponds and new/modified underground stormwater collection system in north Gibsonton
- Construct temporary pavement as necessary to maintain existing two-way traffic (see **Appendix A**).
- Construct and/or widen the northbound or southbound lanes (travel lanes, shoulders or curb and gutter, and sidewalks) while maintaining existing traffic on a combination of existing pavement and newly constructed or temporary pavement.
- Shift traffic to the newly-completed sections of pavement
- Remove temporary pavement where applicable and construct remaining raised medians

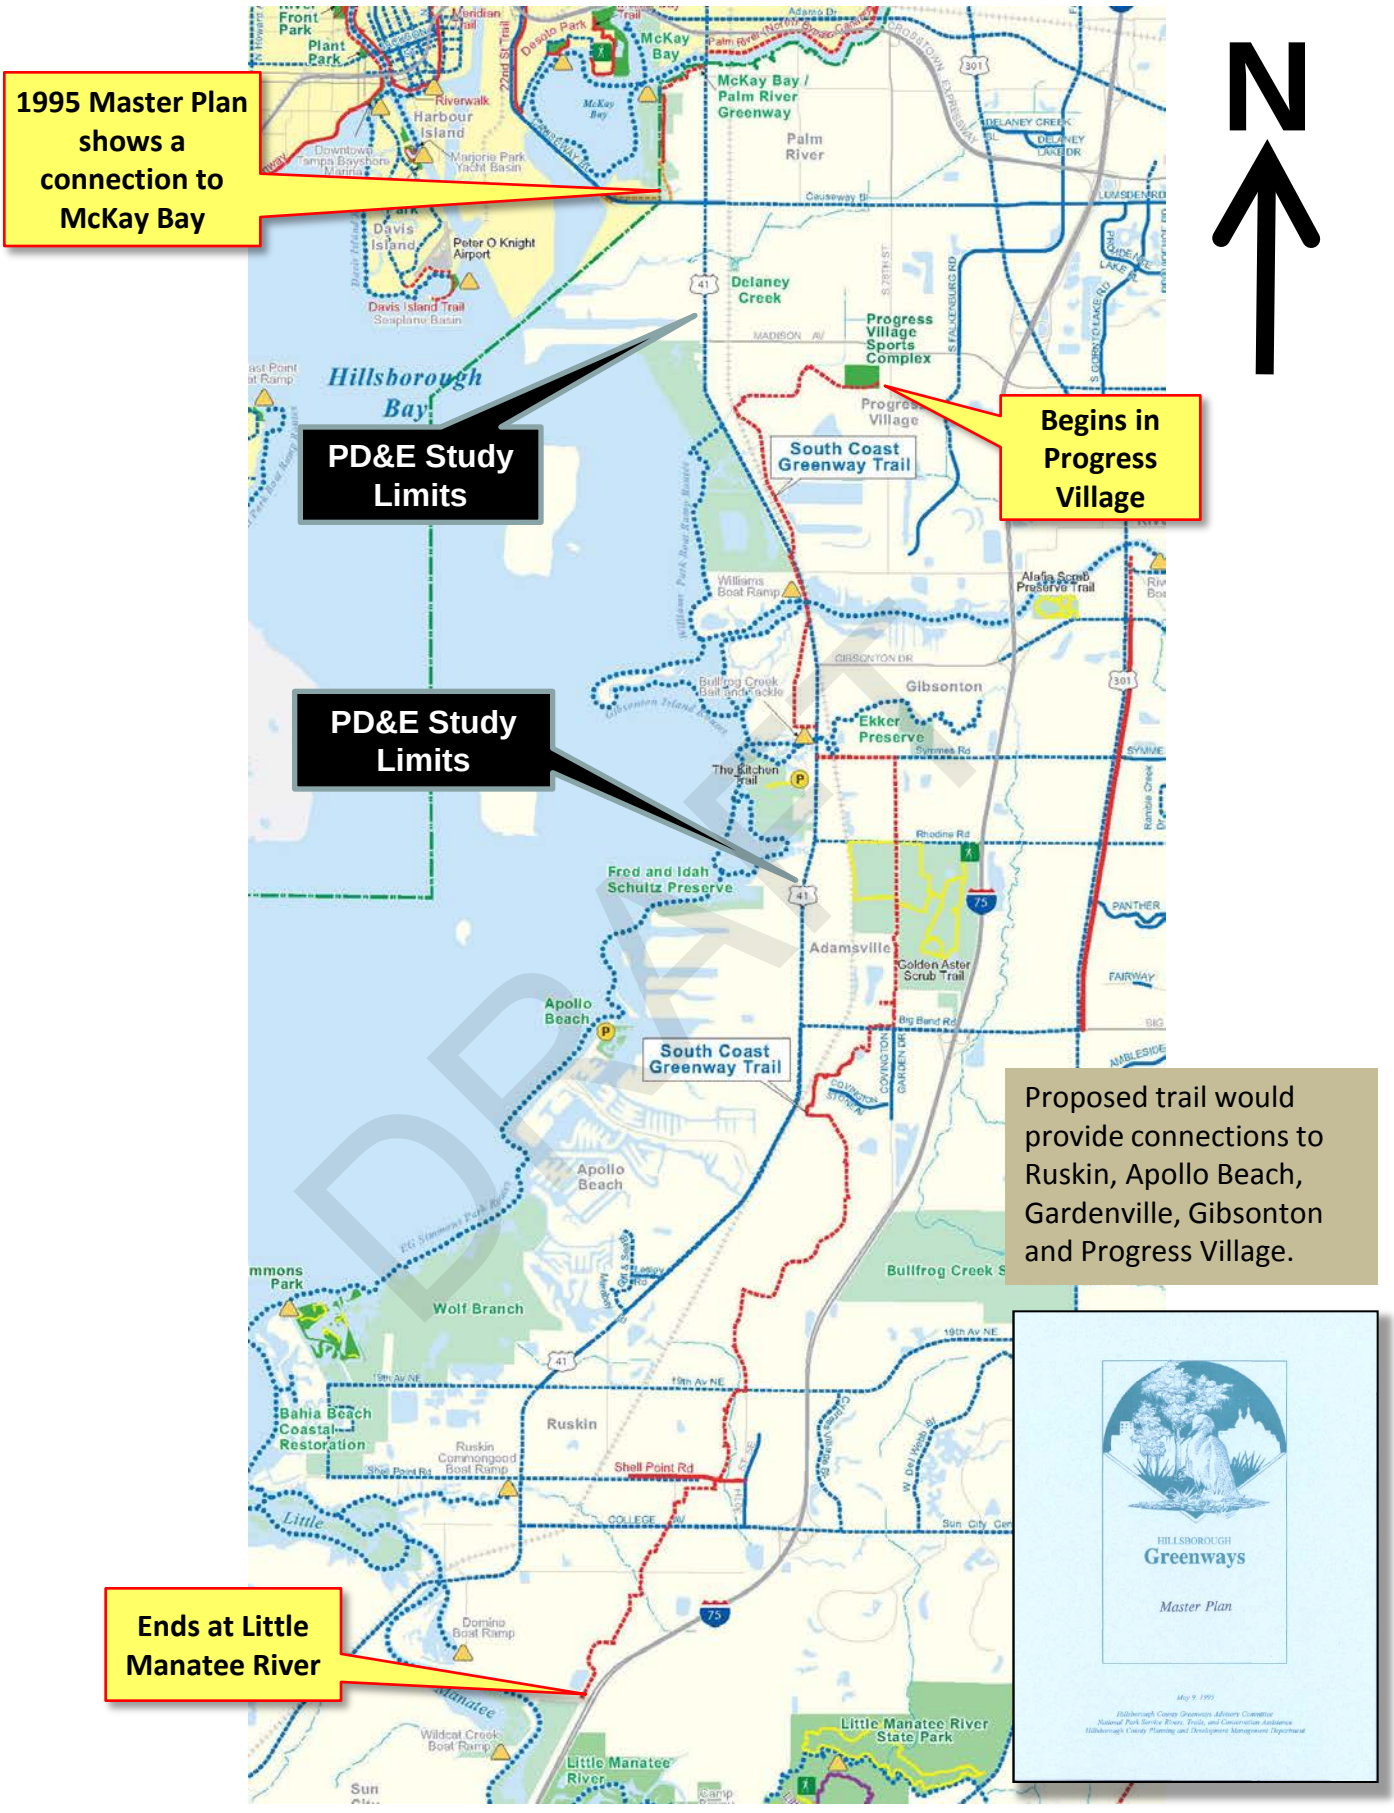
9.12 BICYCLE AND PEDESTRIAN FACILITIES

Sidewalks are included as part of the recommended typical sections. In addition, designated bicycle lanes are included on all recommended roadway and bridge typical sections. All signalized intersections will include pedestrian features such as crosswalks, pushbuttons and pedestrian signal indications.

The future South Coast Greenway is proposed to enter the US 41 corridor at two separate locations in order to cross the Alafia River and Bullfrog Creek, based on the 1995 *Hillsborough Greenways Master Plan.* The overall South Coast greenway route is shown in **Figure 9-1**, and **Figure 9-2** shows the areas where the future trail could run along US 41, within the roadway's ROW. The conceptual design plans in **Appendix G** show potential routes and crossing locations for the future trail near Bullfrog Creek and the Alafia River. The recommended bridge typical sections include a 12-foot shared-use path (trail) on the west side to accommodate the future trail, in addition to sidewalks on the east side.

At the Alafia River location, going from north to south, the trail is currently proposed to run along the east side of US 41 to the river, where it would cross underneath the north end of the new bridge over the river, as shown in **Figure 9-3** and on concept plan sheets 13 and 14 in **Appendix G.** On the west side of the bridge it would connect to Williams Park and also continue northerly along the west side to US 41 to a "switchback" where it would continue to the south, crossing the river on the west side of the new bridge. This proposed trail alignment concept has received tentative approval by county parks department staff at this planning stage. Hillsborough County plans to conduct a separate PD&E study for the South Coast Greenway to evaluate alternative routes between Symmes Road and the northern end of the greenway. South of Symmes Road, several of the greenway's phases are in various stages of design and construction. A maintenance agreement between the county and FDOT will be required before the trail portions within FDOT ROW are designed.

Where new sidewalks are proposed which would cross creeks and streams, the existing pipe, box or bridge culverts will be either extended or replaced (depending on the condition and hydraulic adequacy) in such a manner to allow the sidewalks to cross the creeks and streams on the lengthened (or new) culverts. Another option would be the use of concrete boardwalk.



US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Proposed South Coast Greenway**	**Figure 9-1**

9.13 UTILITY AND RAILROAD IMPACTS

Existing utilities are described in **Section 4.1.12**. Depending on the location and depth of the utilities, construction of the proposed project will likely require adjustments or relocation of some facilities. Cost for utility adjustments are not included in the total estimated project costs presented in **Section 9.6**, since they will be incurred by the utility owners in many cases. Determination of any utility relocation reimbursement costs will be made by FDOT's legal department during the future design phase. Separate coordination and negotiations with Florida Gas Transmission will likely be required during future phases. Coordination with utility owners will be ongoing throughout the study process.

TECO Peoples Gas has advised that there are high pressure gas mains around the US 41 and Madison Avenue intersection. These facilities would be difficult and costly to relocate and may be impacted by the proposed US 41 project. In addition, Hillsborough County Water Resource Services has advised that there are asbestos concrete pipes in the project area. These materials may create a hazardous material work area and require disposal of hazardous materials, if encountered. Utility coordination during the design phase should be done to identify all asbestos concrete pipe locations and therefore help address all environment and safety regulations during construction.

It should be noted that several utilities are currently located under the existing pavement and would also be under the proposed improvements. The relocation costs could be reduced significantly if these utilities were permitted to remain within the travel way. Approval would need to come from both the utility owners and the FDOT. Impacts to existing utility facilities can also be reduced or eliminated if Subsurface Utility Engineering (SUE) is performed during the design phase at potential conflict locations (drainage facilities, traffic signals).

Coordination with CSX Transportation may be required at several locations due to the close proximity of their facilities to US 41, as described in **Section 4.1.12**. The CSX crossings at milepoints 19.403 and 20.169 will need to widened when US 41 is widened in the future. In addition, depending on whether or not Hillsborough County chooses to fund the widening of county road approaches to US 41, railroad crossing widening/reconstruction (including gates, signals and other railroad infrastructure) could be required at the following locations (from south to north):

1. On Symmes Road east of US 41
2. On Gibsonton Road east of US 41
3. On Riverview Drive east of US 41

The current conceptual roadway plans show retaining the existing joint-use ditch that the CSX railroad shares with US 41 on the east side of US 41 between Gibsonton Drive and the Alafia River. For this segment, the roadway widening is proposed to occur to the west side; the east side pavement would remain where it is with the addition of curb and gutter and new sidewalk behind the curb. This would avoid the need for either a temporary construction easement (TCE) or license agreement with CSX.

9.14 RESULTS OF PUBLIC INVOLVEMENT PROGRAM

A plan for the *Public Involvement Program* (PIP) was developed for this study to document the various outreach opportunities available for property owners, public officials, agencies, and other stakeholders and interested parties. The program included an Advance Notification (AN) Package, several newsletters, and will include a future public hearing. The results of the entire program will be summarized in a *Comments and Coordination Report* at the conclusion of the study.

Although no public meetings or workshops have been held to date, several presentations have been given to various agencies/groups, as listed in **Table 9-4**. Minutes of these meetings are available in the project files.

Table 9-4 Summary of Presentations to Agencies/Groups

Date	Agency/Group	Meeting/Presentation Purpose
10/16/13	MPO's Citizens Advisory Committee (CAC)	Kick off and study update
10/21/13	MPO's Technical Advisory Committee (TAC)	Kick off and study update
10/31/13	Hillsborough Co. Dept. of Public Works (DPW)	General project update and to review proposed intersection improvements
1/22/14	CSX Transportation	To discuss potential ROW impacts
1/22/14	SWFWMD	Pre-Application Meeting
4/1/14	Hillsborough Co. Parks Dept.	General project information and to discuss Williams Park and South Coast Greenway
4/30/14	Port Tampa Bay (FKA Tampa Port Authority)	General project update and review impacts to port facilities
5/30/14	Mosaic	General project information & discuss Riverview Drive intersection
8/8/14	Mosaic and Hills. Co. Parks and DPW Representatives	Project update and discussed Riverview Drive intersection and South Coast Greenway
8/19/15	SWFWMD	Second "pre-app" meeting

9.15 VALUE ENGINEERING RESULTS

A value engineering (VE) study was conducted as part of this PD&E study. It included a kick-off meeting and presentation on May 4, 2015 and a final presentation to FDOT management on September 6, 2015, with the final report and decision matrix received on October 12, 2015. A copy of the signed Decision Matrix is included as **Table 9-5**, and the executive summary from the final VE study report is included in **Appendix F**.

Table 9-5 Value Engineering Study Signed Decision Matrix

Value Engineering Study - Decision Matrix

US 41 (State Road 45); PD&E Phase
From Kracker Avenue
To South of SR 676 (Causeway Blvd.)

FINANCIAL MANAGEMENT NUMBER: 430056-1

STUDY NUMBER: 15-007-05

	Recommendations	Decision*	Comments**	Potential Cost Impact (-) VE Estimated Savings (+) Value Added
1.	Value Engineering Alternative No. 1A: Widen the existing roadway instead of total reconstruction and eliminate attenuation to tidal outfalls to reduce pond sizes.	Accepted	Value Engineering Alternative No. 1A is approved. Evaluate the possibility of all inside or all outside widening which is easier to construct than widening each roadway on both sides. Also, evaluate water table impacts to existing pavement. Try to design ditches to be dry.	(-) $ 24,100,000
2.	Value Engineering Alternative No. 4: Reduce the two inside lane widths to 11 feet and retain the 12 ft. outside lane from Kracker Avenue to Palm Avenue and from the south end of the Alafia River Bridge to the Madison Avenue intersection.	Accepted	Approved on the condition that further analysis is done in design to determine impacts and/or justify the required variation. Assume all 12 foot lanes for current estimates.	(-) $1, 930,496
3.	Value Engineering Alternative No. 5: Mill and resurface existing pavement and widen instead of total reconstruction.	Accepted	Evaluate the possibility of all inside or all outside widening which is easier to construct than widening each roadway on both sides. Also, evaluate water table impacts to existing pavement.	(-) $5,740,519
4.	Value ADDED Alternative No. 1: Consider concrete pavement at Madison Avenue and Port Sutton Road.	Accepted	Check with Brian Hunter for compatibility with district concrete pavement plan.	(+) $1,724,683

* Decision to accept, decline or accept with modifications

** Reason for declining or explanation of modification if required

Director's Signature Date 10/9/15

Several initial recommendations made by the VE study team were dropped from further consideration after additional analysis/input by others, for example, widening of the bridges at Bullfrog Creek and the Alafia River in lieu of bridge replacement.

The recommendation to use 11-foot interior lane widths for the suburban typical section areas (outside of the north Gibsonton area) would require a design variation and will be further evaluated during the future final design phase.

With respect to drainage-related issues, following the initial VE study findings, the PD&E study team held a second "pre-app" meeting with SWFWMD to review attenuation requirements for stormwater runoff at the preliminarily-selected SMF pond sites. It was determined that attenuation would not be required for many of the potential SMF pond sites where the outfall would directly connect to tidally-influenced water bodies. As a result, estimated sizes and costs of SMF ponds were reduced.

With respect to full roadway reconstruction verses widening with milling and resurfacing, this will need to be reviewed during the future design phase when geotech and survey data will be collected to help make the determination.

The LRE construction cost estimate was updated in September 2015 to include concrete pavement approaches at three intersections with heavier truck traffic, and it was also updated to reflect the smaller size SMF pond sites required.

9.16 DRAINAGE AND STORMWATER MANAGEMENT

The following information is from the *Draft Pond Sizing Report* prepared for this study.

Design Criteria for Attenuation - For basins with a positive outfall, and that do not discharge to an infinite basin, SWFWMD will require the proposed discharge rate from the basin be less than or equal to the existing discharge rate for the 25-yr/24-hr SWFWMD storm event. Additionally, FDOT Criteria requires Florida Administrative Code 14-86 evaluation for closed basins or basins with historical flooding.

The majority of the basins are considered to meet the infinite basin criteria based on conceptual pond outfall locations, as discussed with SWFWMD August 19, 2015, and are not anticipated to require any discharge attenuation. The project basins within Black Point Drain will require pre vs. post discharge attenuation.

Design Criteria for Water Quality

1. A wet detention treatment system shall treat one inch of runoff from the contributing area.
2. A manmade wet detention system shall include a minimum of 35 percent littoral zone, concentrated at the outfall, for biological assimilation of pollutants. The treatment volume shall be no greater than 18 inches above the control elevation (orifice elevation/SHWL).

3. The wet detention system's treatment volume shall be discharged in no less than 120 hours (5 days) with no more than one-half the total volume being discharged within the first 60 hours (2.5 days).

Criterion 1 was utilized to estimate the required water quality for the wet pond. Criteria 2 and 3 will be implemented in final design. Dry retention pond is provided as well for the following reason: due to the impaired status for many of the receiving water bodies it is necessary to demonstrate that the project will not contribute to the impairment through demonstration of no net increase in nutrient loading from the project (pre vs. post nutrient loading comparison). Based on the Nutrient Loading calculations, a wet pond would not be capable of meeting requirements for nutrient loading for some basins, therefore dry detention ponds have being considered in the estimation of pond sizing requirements.

Drainage Areas - The impervious drainage areas for each basin were determined as the basin length multiply by a typical impervious width. The pervious drainage areas were subtracted from the total drainage areas calculated as the basin length multiply by a typical ROW width of 182 feet. The calculations presented here are preliminary and help in estimating the preliminary size of the pond site facilities for each basin. The size requirements are preliminary based upon many assumptions and judgments. The results are tabulated on **Table 9-6**. Historical drainage maps from District 7 are included in **Appendix D**.

A combination of dry retention and wet detention ponds are recommended for providing stormwater management to serve the proposed US 41 improvements. **Table 9-6** classifies the stormwater management facility (SMF) size requirements per basin. **Table 9-7** shows the estimated floodplain encroachment area, estimated floodplain encroachment volume, and estimated floodplain compensation (FPC) site area.

Table 9-6 Required Estimated Pond Size Areas

Regional Basins	Project Basin No.	Project Basin Boundaries	Project Basin Acreage (ac)	SMF Total Area (ac)

	Totals	12.72		14.16

①*The estimated floodplain encroachment area is based on a 26.5 ft width per the length of encroachment per side.*
②*An estimated fill depth based on contour data and the average depth was estimated per basin.*
③*An estimated of 1.25 determined the FPC site area.*

.

9.17 STRUCTURES

The proposed widening of US 41 will require the existing bridges and bridge culverts to either be widened or replaced.

Bridge Culverts

All three of the multi-celled 10'x6' bridge culverts currently have a sufficiency rating of 74 and load rating values that exceed 1.0 which would indicate that they are suitable for widening. It is much more cost effective to extend these bridge culverts rather than to replace them; however, these culverts were constructed in 1943 and then widened in 1959 so they are currently 71 years old. It is recommended that the condition of these culverts at MP 20.271, 20.686 and 21.084 be verified to confirm that the structural adequacy has not deteriorated prior to preparing the culvert extension plans during the future design phase.

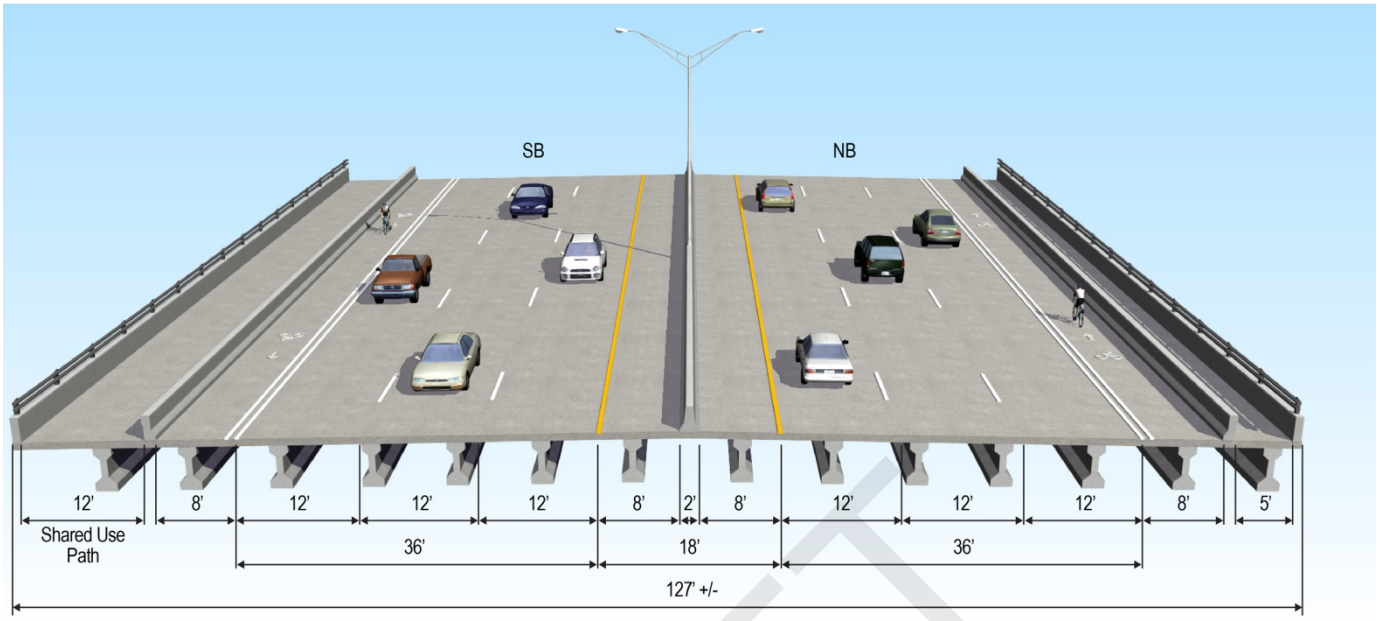
Although it is located north of the expected limits of construction for the proposed highway widening, the bridge culvert at MP 23.003 over Delaney Creek was constructed in 1959 and has a sufficiency rating of only 56.7. It is recommended to replace this triple 12'x8.25' bridge culvert.

Bullfrog Creek Bridges

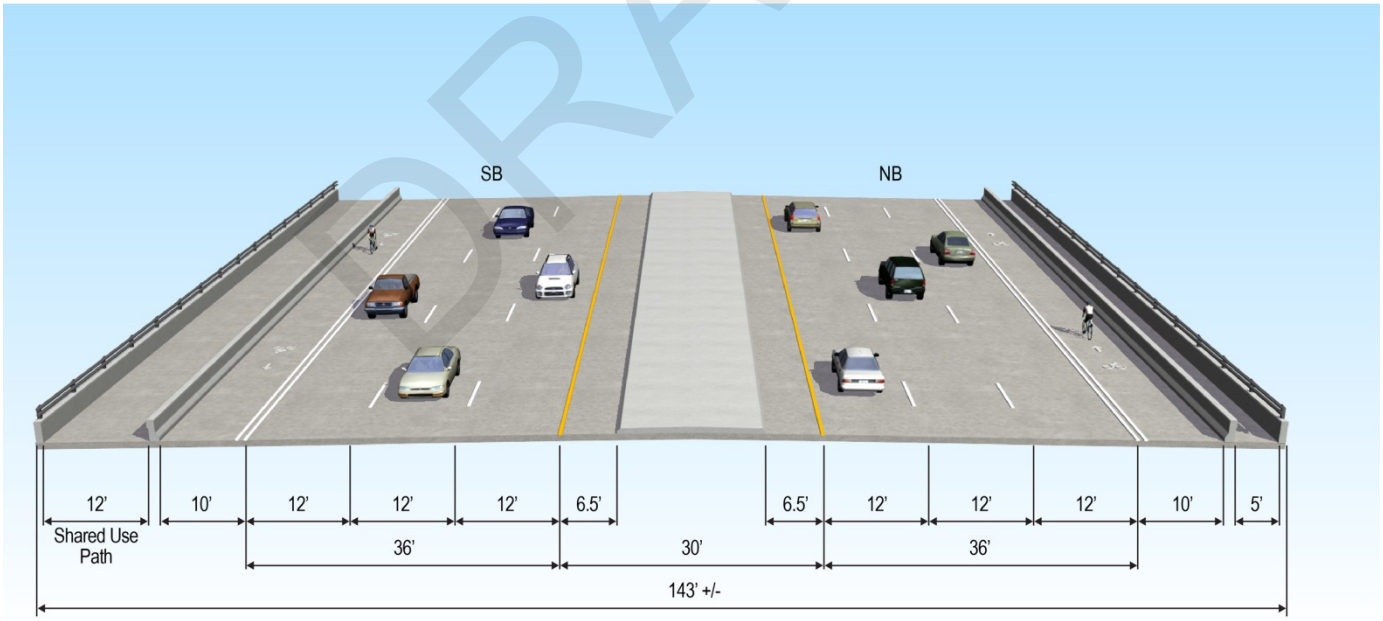
The bridges at Bullfrog Creek will need to be replaced to accommodate the additional lane of traffic in each direction. The configuration of the proposed bridge includes three 12-foot lanes in each direction with 6 foot-6 inch inside shoulders and 10-foot outside shoulders which would be designated as bike lanes (**Figure 9-4**). The cross section includes a 17-foot raised median between the inside shoulders and F-shaped barriers to protect the 5-foot sidewalk on the east side of the bridge and a 12-foot shared-use path on the west side to accommodate the future South Coast Greenway planned by Hillsborough County.

The alignment of the new bridge will need to be shifted either to the west or east due to the need to maintain four lanes of traffic during construction. For example, the bridge alignment could be shifted 11 feet-9 inches to the west from the center of the ROW in order to facilitate the maintenance of traffic. This allows the westernmost portion of the bridge to be constructed while southbound traffic remains on the existing bridge. The southbound pedestrian and vehicular traffic can then be shifted to this newly constructed portion of the proposed bridge permitting the existing southbound bridge to be removed and the center portion of the proposed bridge to be constructed. The northbound traffic could then be shifted to the center portion of the new bridge allowing the existing northbound bridge to be removed and the remaining portion of the new bridge to be constructed. Two alternative construction sequence plans are shown in **Appendix B.** Based on the need to minimize ROW costs, the west-shifted alignment alternative is recommended for this location and is shown on the concept plans.

(All views are looking north)



Bridge at Alafia River



Bridge at Bullfrog Creek

Rev. 12/12/14

US 41(SR 45) PD&E Study *From Kracker Avenue to South of SR 676 (Causeway Blvd)* WPI Segment No. 430056 1 - Hillsborough County	**Recommended Bridge Typical Sections**	**Figure 9-4**

The above construction sequence assumes that the bridges will be replaced due to their age, but if the bridges are widened, then a similar process could be used but instead of removing the existing bridges, the widened portions of the new bridge would simply be either doweled into the existing slab or else a portion of the existing bridges would be removed to allow the proposed transverse reinforcing to splice with the existing transverse reinforcing.

While widening the existing flab slab bridge is feasible, it would require the widening to use the same span arrangement as the existing bridges which is 14 spans for the 211-foot northbound bridge and 10 spans for the 203-foot southbound bridge. In addition, the northbound bridge is classified as *scour critical* so steps should be taken to strength the foundations and/or prevent scour for this bridge. Another obstacle to widening is that the low member of the proposed bridge would be at least 5¼ inches lower than the existing low member so the vertical clearance would be decreased. Final consideration is that the southbound bridge was built in 1960 so it is already 55 years old in 2015 while the northbound bridge is 70 years old since it was constructed in 1945. The sufficiency ratings for these bridges are 77.2 and 75.2 for the southbound and northbound bridge respectively but they are approaching their expected 75-year life span and it is reasonable to expect the costs for maintaining these bridges will increase at a faster rate as they age. Based on this information, replacing the bridges is expected to result in a lower lifecycle cost. A preliminary life-cycle cost analysis for all bridges is included in **Appendix C**.

Replacing the bridges would also allow a more economical span arrangement for these bridges that are approximately 210 feet in length. A three-span configuration using Florida-I beams (FIBs) that are 36-inch deep supported on prestressed, concrete pile bents are likely the most economical solution.

Alafia River Bridges

The proposed typical section for the bridge over the Alafia River is similar to the Bullfrog Creek typical in that both accommodate three 12-foot lanes in each direction with a 5-foot sidewalk on the east side of the bridge and a 12-foot shared-use path on the west side and F-shaped barriers to protect the pedestrians and trail users (**Figure 9-4**). The Alafia River Bridge would use 8-foot inside and outside shoulders with the outside shoulder designated as a bike lane. There is also a median barrier separating the southbound and northbound traffic.

The proposed alignment of the new bridge would be shifted approximately 10 feet to the west from the center of the ROW. As with the bridge at Bullfrog Creek, this shift allows the westernmost portion of the bridge to be constructed while southbound traffic remains on the existing bridge. The newly constructed portion of the proposed bridge can then be used to convey the southbound pedestrian and vehicular traffic allowing the existing southbound bridge to be removed and the center portion of the proposed bridge to be constructed. The center section of the bridge can then be used to carry the northbound traffic permitting the existing northbound bridge to be removed and the last portion of the proposed bridge to be constructed, as shown in **Appendix B.**

As with Bullfrog Creek, the construction sequence is based on replacing the bridge. A similar scheme could be used if the bridge is widened. However, the sufficiency rating of the northbound bridge is only 68 and the cost of maintaining the existing steel beams will continue to increase at a faster rate as this bridge ages beyond its current age 63 years old in 2015. The existing southbound bridge uses post-tensioned AASHTO Type II beams for the two 78-foot spans while the northbound bridge uses continuous steel-I beams requiring the widened bridges to use similar beams to maintain similar structural rigidity between the existing and proposed bridges. In addition, the existing bridge span configuration of 40 foot and 60-foot approach spans with 78-foot center spans results in a widening that would not be very efficient.

Based on the above information, replacing the existing bridges is expected to result in a lower life-cycle cost. The replacement bridge will likely use FIBs that are either a 36-inch or 45-inch depth that can easily span distances over 90 feet and 110 feet respectively. These longer spans can eliminate almost half of the foundations in the river improving the hydraulics of the river and resulting in a more aesthetically pleasing structure. It is assumed that the existing bridge fender system will either be extended or replaced in its current location, which aligns with the railroad swing bridge located immediately to the east of the Alafia River bridges.

Other - In addition to the bridge culverts mentioned above, other pipe and box culverts will be either extended or replaced to accommodate the wider roadway, depending on the condition and hydraulic adequacy at the time of the future design phase. Widening verses replacement of the existing bridge structures is also addressed in the *Final Value Engineering Study Report*.

9.18 SPECIAL FEATURES

FDOT may consider context sensitive solutions such as aesthetic features and landscaping during the design phase so that the project is in harmony with the community and preserves and/or enhances the natural, environmental, scenic and aesthetic values of the area. The placement and maintenance of any landscaping shall comply with the required clear zone and sight distance at intersections. No other provisions or commitments have been made yet regarding special aesthetic features, lighting, or noise walls.

9.19 ACCESS MANAGEMENT

A meeting was held with the FDOT's District Access Management Engineer in September 2014 to review the proposed access management plan for the proposed project. The existing access management classification is Class 3 for most areas of US 41. No change is recommended in the classification. The minimum spacing for full and directional median openings should ideally follow the standards for Access Class 3 shown in **Table 6-2**. Many of the existing openings, especially in the north Gibsonton area, do not meet Class 3 spacing standards.

Table 9-8 shows the proposed median opening locations for the recommended Build Alternative, and the conceptual design plans included in **Appendix G** show the locations of proposed directional and full median openings as depicted in the table. Some existing median openings are proposed for

closure, some full median openings will be changed to directional median openings to prevent certain turning movements, and the locations of several median openings are proposed to be shifted to better meet Access Class 3 spacing standards. For those proposed median opening locations that do not meet minimum Access Class 3 standards, the percent deviation from the standards is shown in the table. In general, the District Access Management Engineer provided verbal concurrence for the proposed access management plan.

Class 7 Standards: Directional Openings: 330'
Full Openings: 660'
Traffic Signals: 1320' (1/4 mi)

9.20 POTENTIAL CONSTRUCTION SEGMENTS AND PHASING

Due to potential funding limitations at the time of construction, several options exist to segregate the proposed project into various construction segments. One option would be to segregate them based on the proposed typical sections. This would result in the following segments, excluding the Alafia River Bridge:

1. Kracker Avenue to Palm Avenue: 1.9 miles
2. Palm Avenue to Alafia River Bridge: 1.2 miles
3. Alafia River Bridge to Austin St: 3.7 miles

The Alafia River bridges replacement could be broken out as a separate project due to the high cost and the need for USCG approval and permit. Other segmenting options are available and these could consider other factors such as required utility relocations and variation in traffic congestion from segment to segment.,

Advance funding for ROW acquisition could include securing potential off-site pond areas, or negotiating with properties that become listed for sale by the property owners. As developments are submitted for approval to Hillsborough County, provisions for land dedications and accommodations of drainage, floodplain and wetland impacts should be considered in accordance with the County's Comprehensive Plan and Land Development Code.

9.21 WORK PROGRAM SCHEDULE

No future phases are currently programmed other than routine maintenance/resurfacing.

Table 9-9 shows other planned and recent past projects within or near the study area.

Table 9-9 Other Past and Planned Projects in the Study Area

Work Type	Description	WPI No.	Fiscal Year(s)	Total Budget
Planned Projects				
Railroad Crossing	US 41 from N of Old US 41A to S of Archie Creek	434029-1	2017 & 2018	$1.0 million
Resurfacing	US 41/SR 45 from S of Bullfrog Creek to Denver Street	434848-1	2018	$6,381,070
Add Lanes and Reconstruct	Madison Avenue from US 41 to 78th St	437002-1	2020	$7,000,000

Appendix C
Bridge Life Cycle Cost Analysis

Compare Rehabilitation Option vs Replacement Life Cycle Costs
US 41 NB and SB over Bullfrog Creek - Bridge Nos. 100106 & 100044

Retain 69 year old NB bridge (#100106 - SR = 75.2 & HI = 89.6) and 54 year old SB Bridge (#100044 - SR = 77.2 & HI = 87.65) versus replacement

PW=(1+f)^n/(1+i)^n where, interest rate, I = 5 % and inflation rate, f = 2 %

Notes:

	Proposed Width	Existing Width	Widening Width (+2' splices)							
Widen bridges cost ==>	143.00	68.92	78.08 '	wide	x	207 '	long	x	$140 /SF	= $2,262,855
Scour Protection cost ==>	68.92 '	wide	x	207.00 '	long	x	$35 /SF	=	$499,301	
Deck maintenance costs are estimated to be $30/SY for 0% of deck for 0-30 yrs, 5% of deck for 40-60 yrs, 10% of deck for 60+ yrs.										
Install/Repair 5' length of pile jackets on 40% of the piles at $210/LF after 20 '	long	x								
Bridge Replacement cost ==	143.00 '	wide	x	207.00 '	long	x	$110 /SF	=	$3,256,110	

Retain and Widen/Repair Existing Bridges (both bridges) + Replace when existing bridge reach average age of approximately 90 years:

Year	Average Bridge Age	PW Factor	Widening Cost	Spall and Crack Repair	Scour Protection	Pile Jackets	Total Maint	PW Maint	Total PW	
0	62	1.000	2,262,855	88,803	499,301	0	588,104	588,104	2,850,959	Widening Existing Bridges
10	72	0.748	0	88,803	0	0	88,803	66,456	66,456	
20	82	0.560	0	88,803	0	0	88,803	49,733	49,733	
30	0	0.419	3,256,110	0	0	43,680	43,680	18,307	1,382,969	
40	10	0.314	0	0	0	0	0	0	0	Replace Existing Bridges

80	80	0.098	0	88,803	0	88,803	8,736	8,736	
90	90	0.074	0	88,803	0	88,803	6,537	6,537	
						Total Present Worth Cost =		$3,322,876	

Recommendation: Based on the above Present Worth Cost analysis, a savings of $1,040,715 can be realized by using the bridge replacement option.

Compare Rehabilitation Option vs Replacement Life Cycle Costs
US 41 NB and SB over Alafia River - Bridge Nos. 100107 & 100045

Retain 62 year old NB bridge (#100107 - SR = 68 & HI = 94.09) and 55 year old SB Bridge (#100045 - SR = 78.9 & HI = 87.64) versus replacement
PW=(1+f)^n/(1+i)^n where, interest rate, I = 5 % and inflation rate, f = 2 %

Notes:

	Proposed Width	Existing Width	Widening Width (+2' splices)							
Widen bridges cost ==>	128.00	71.46	60.54 '	wide	x	1215.90 '	long	x	$150 /SF	= $11,041,892

Concrete maintenance costs are estimated to be $30/SY for 0% of deck for 0-30 yrs, 5% of deck for 40-60 yrs, 10% of deck for 60+ yrs.
Steel Girder Repainting costs are estimated to be $1,200 / TN x 109 TN = $130,800
Install/Repair 10' length of pile jackets on 40% of the piles at $210/LF after 20 years ' long x
Bridge Replacement cost == 128.00 ' wide x 1215.90 ' long x $110 /SF = $17,119,872

Retain and Widen/Repair Existing Bridges (both bridges) + Replace when existing bridge reach average age of approximately 90 years:

Year	Average Bridge Age	PW Factor	Widening/ Replacement Cost	Spall and Crack Repair	Steel Girder Repainting	Pile Jackets	Total Maint	PW Maint	Total PW	
0	59	1.000	11,041,892	233,453	130,800	35,700	399,953	399,953	11,441,845	Widening Existing Bridges

FINAL REPORT

THE FLORIDA DEPARTMENT OF TRANSPORTATION DISTRICT 7

This report includes a summary of data collection, alternative analysis, and Value Engineering recommendations. I acknowledge that the procedure and reference used to develop the results contained in the report are standard to the Professional Practice of Value Engineering, as applied through Professional Judgment and Experiences. I hereby certify that I am a Registered Professional Engineer in the State of Florida and that this study has been performed in the accordance with current applicable FDOT Value Engineering Procedures.

TABLE OF CONTENTS

I. EXECUTIVE SUMMARY

INTRODUCTION

This Value Engineering report summarizes the results of the Value Engineering Study performed by ***VE Group, L.L.C.*** for the Florida Department of Transportation District 7. The study was performed during the week of ***MAY 4-7, 2015.***

PROJECT DESCRIPTION

The proposed Florida Department of Transportation (FDOT) project involves the widening of US 41 (SR 45) from Kracker Avenue (milepoint 15.784) to south of SR 676 (Causeway Boulevard-milepoint 23.547 in Hillsborough County. The study limits length is approximately 7.7 miles. The proposed widening would end in the vicinity of Denver Street, where US 41 is already six lanes to the north. The highway is proposed to be widened/reconstructed from an existing, four-lane divided rural and urban facility to a six-lane divided facility, with suburban typical sections in the areas with the existing 182-foot right of way (ROW) and an urban typical section in the north Gibsonton area where the ROW is much narrower. In addition, the bridges over Bullfrog Creek and the Alafia River are proposed to be replaced and include space for the future South Coast Greenway, which will run parallel to US 41 in several areas. The proposed improvements will include construction of stormwater management facilities and floodplain compensation sites and improvements at major intersections, in addition to inclusion of multimodal facilities (trail, pedestrian, bicycle and transit accommodations).

Total estimated **Construction Cost** (from LRE provided to VE team): ***$105,985,756***.

Estimated **Right of Way** cost: ***$34,500,000***.

I. EXECUTIVE SUMMARY

METHODOLOGY

The Value Engineering Team followed the basic Value Engineering procedure for conducting this type of analysis.

This process included the following phases:

1. Information
2. Functional Analysis
3. Speculation
4. Evaluation
5. Development
6. Presentation
7. Report Preparation/Resolution

AREAS OF FOCUS

A Pareto Chart and a Functional Analysis Worksheet are tools of the Value Engineering Process and are only used for determining the areas that the Value Engineering Team may focus on for possible alternatives. After development of the Pareto Chart and Functional Analysis Worksheet, the Value Engineering Team focused on the following Areas of Focus:

A. PONDS

B. ALAFIA RIVER BRIDGES

C. PAVEMENT/TYPICAL SECTION

D. BULL FROG CREEK BRIDGES

E. INTERSECTIONS

I. EXECUTIVE SUMMARY

RESULTS – AREAS OF FOCUS

The following areas of focus were analyzed by the Value Engineering team and from these areas, the following Value Engineering alternatives were developed and are recommended for Implementation. It should also be understood that the calculated savings shown in this Value Engineering Report are *potential* cost savings and are the best projections based on the conceptual data available at this time. Actual savings would have to be based on detailed quantity calculations that could not be made unless final design plans, with detailed quantities, were to be developed for both the original concept and the VE concept. Once the VE concept is adopted, however, the cost estimate for the original concept is no longer updated which precludes a detailed comparison with the VE concept estimate. In addition, the cost estimate represents the amount needed to construct the project in present day cost. This does not necessarily mean that there are available funds for this amount and thus, any amount saved by a VE concept is not necessarily available for other projects.

RECOMMENDATION NUMBER 1: **PONDS**

The Value Engineering Team recommends that *Value Engineering Alternative No.1A* be implemented.

Value Engineering Alternative No. 1A: ***Widen the existing roadway instead of total reconstruction and eliminate attenuation to tidal outfalls to reduce pond sizes.***

If this recommendation can be implemented, there is a ***possible savings of $24,100,000.***

RECOMMENDATION NUMBER 2: **PAVEMENT/TYPICAL SECTION**

The Value Engineering Team recommends that *Value Engineering Alternative No. 4* be implemented.

Value Engineering Alternative No. 4: ***Reduce the two inside lane widths to 11 feet and retain the 12 ft. outside lane from Kracker Avenue to Palm Avenue and from the south end of the Alafia River Bridge to the Madison Avenue intersection.***

If this recommendation can be implemented, there is a ***possible savings of $1,930,496.***

If this recommendation can be implemented, there is a possible ***Life Cycle Cost savings of $1,930,496.***

I. EXECUTIVE SUMMARY

RESULTS – AREAS OF FOCUS - continued

RECOMMENDATION NUMBER 3: **PAVEMENT/TYPICAL SECTION**

The Value Engineering Team recommends that *Value Engineering Alternative No. 5* be implemented.

Value Engineering Alternative No. 5: ***Mill and resurface existing pavement and widen instead of total reconstruction.***

If this recommendation can be implemented, there is a ***possible savings of $5,740,519.***

If this recommendation can be implemented, there is a ***possible Life Cycle Cost savings of $5,740,519.***

RECOMMENDATION NUMBER 4: **INTERSECTIONS**

The Value Engineering Team recommends that Value Engineering Alternative No. 7 be implemented.

Value ADDED Alternative No. 1: ***Consider concrete pavement at Madison Avenue and Port Sutton Road.***

If this recommendation can be implemented, there is a possible ***INCREASE of $1,724,683.***

I. EXECUTIVE SUMMARY

RESOLUTION/FHWA CHART

The following Value Engineering Alternatives were developed and are recommended for Implementation:

VALUE ENGINEERING RECOMMENDATIONS	RECOMMEND ACCEPT	RECOMMEND REJECT	MODIFY STUDY FURTHER	FHWA CATEGORIES	
RECOMMENDATION NUMBER 1: ***PONDS*** ***<u>Value Engineering Alternative No.1A</u>:*** ***Widen the existing roadway instead of total reconstruction and eliminate attenuation to tidal outfalls to reduce pond sizes.*** *(See pg. **31** for details)* ***Possible savings of $24,100,000***	***ACCEPT – Pursue dry swales, if possible, further refining in design phase.***			**SAFETY: Recommendations that mitigate or reduce hazards on the facility.**	
				ENVIRONMENT: Recommendations that successfully avoid or mitigate impacts to natural and/or cultural resources.	**X**
